SOLUTIONS

An expanding universe  
of solutions.

**Digivoice:**  
the digital system.

**urmet**

## An infinity of solutions.

So, think big!

But we mean really big, because the Digivoice System is the latest item to emerge from Urmet Domus' lengthy experience in the Digital-Dial Systems field.

Now Digivoice is offering the most advanced solution for house entryphone equipment, including extended, with hands-free entryphones, traditional handsets and combined models.

Video entryphone systems are also available.

Moreover Digivoice will never reply with an engaged tone, which is typical of other systems, because it has a dual voice line capability for two simultaneous conversations from the main call stations and it is even possible to hold further conversations from secondary call stations.

Digivoice enables connection of up to 5 concierge switchboards in parallel on the same applications and overall programming of functions: making all the switchboards ring or enabling them with separate functions that may then be swapped from one switchboard to another.

The switchboard may also be interfaced with a Personal Computer via free software. The Digivoice System has been made deliberately simple to programme and the decoder may be programmed during installation, even if the system is powered down.

D-Voice, Urmet Domus free software, available from the download area of the website, enables fast programming of directories and creates an information database.

## General Features

- > 4 models of door phones with handsets are available. The 1138/3 on Atlantico design and the 1138/4 on Utopia design, used with decoders for floor call, whilst the 1138/31 fits a single decoder to be connected directly to the apartment riser cable. The 1138/18 is the special door phone, fitted with a single decoder and telephone key pad, used for intercom functions with all the other door phones present in the system.
- > The hands-free door phones, used with decoders for floor call, offer call volume adjustment, MUTE, automatic door opening and two special keys. A small optional module will enable a hands-free conversation function.
- > The Scaitel colour video module is compatible with 1138/31 and 1138/18 door phones and with the concierge switchboard.
- > The elegantly designed ergonomic concierge switchboard may be used as table top or wall mounted. Fits a graphics display unit and backlit keyboard
- > All the Urmet Domus monitors can be used in the system, from the cheapest Artico, moving to Atlantico b/w and colour up to the top level Utopia both in handset and hand-free version.

An infinity of solutions >>>

# Technological Evolution.

## A never ending story.

The technological evolution of a system like Digivoice is infinite: the exceptional performance offered today is not a point of arrival, but the start of a large-scale technological journey.

A few examples.

All entryphones are fitted with high acoustic yield speakers, dedicated to announcing a call.

By simply connecting the landing button to the decoder a floor call is obtained: when the button is pressed the entryphone will ring with a different tone from that used for external calls, even if a conversation is in progress.

The MUTE function will turn off the call volume at any internal station. Digivoice offers an extra security level.

In fact, with the special decoder and cycle switch enable automatic inclusion of the video for different video and CCTV stations, so just by pressing the video entryphone button different rooms or areas in a building can be checked. This way even when there are no calls, entries, garages, courtyards and car passageways can be monitored. The special decoder also makes it possible to manage any auxiliary services such as switching on stairwell lights, opening car passageways and other functions, which increases the equipment's added value.

A video camera controlled automatically by the system may also be fitted to the switchboard, so that internal stations may pick up the image of the switchboard operator or of the visitor who is requesting entry.

## General Features

- > The digital-dial module is available in two versions. One on dual Sinthesi modules, the 1038/13 which has an integrated directory and backlit LCD display, the other, the 1038/16, is on a dual module K-Steel and also offers a directory and LCD display. All modules handle alphanumerical calls via optional alphabetic keypads, the 1038/74 for the Sinthesi and the 1038/73 for the K-Steel.
- > 2 door speaker unit models with integrated digitizer: the first, the 1038/7, may be used Sinthesi, whilst the second, 1038/5, is on K-Steel module with two call buttons already fitted. Both have standard 8 button management, expandable up to 104 using 1038/17 expansion modules.

A never ending story >>>

## Amazing performances.

Digivoice will enhance your system with new features that make it unique in its field.

In fact, the special single decoder entryphone has a telephone keypad and may therefore be compared to an entryphone switchboard solely for internal services. This means that calls may be made or received from any of the system's other internal stations, and unanswered calls can be stored.

This will be extremely useful when there are requests from stations serving the interior of the building such as the garage, laundry, maintenance or other services.

Or if an intercom service is required for offices or apartments. Digivoice's range of application extends even further with its audio adaptor device (with traditional audio and video entry systems 4 + no. of wires).

For instance, the telephone switchboards inside an apartment or office can be used without modifying system features.

Or again, the device allows creation of mixed systems, for instance for residential complexes composed of single-family houses, each with its own traditional entry system and one or more shared entrances, with Digivoice call stations and any concierge switchboards.

Today, the Digivoice system offers not only numerical or alphanumeric digital-dial modules, it is also possible to use traditional keypads (audio and video entry systems) with up to 104 buttons per call station.

Externally located digitizers enable the use of different keyboards such as Synthesi, Aura, K-Steel.

Astounding performances >>>

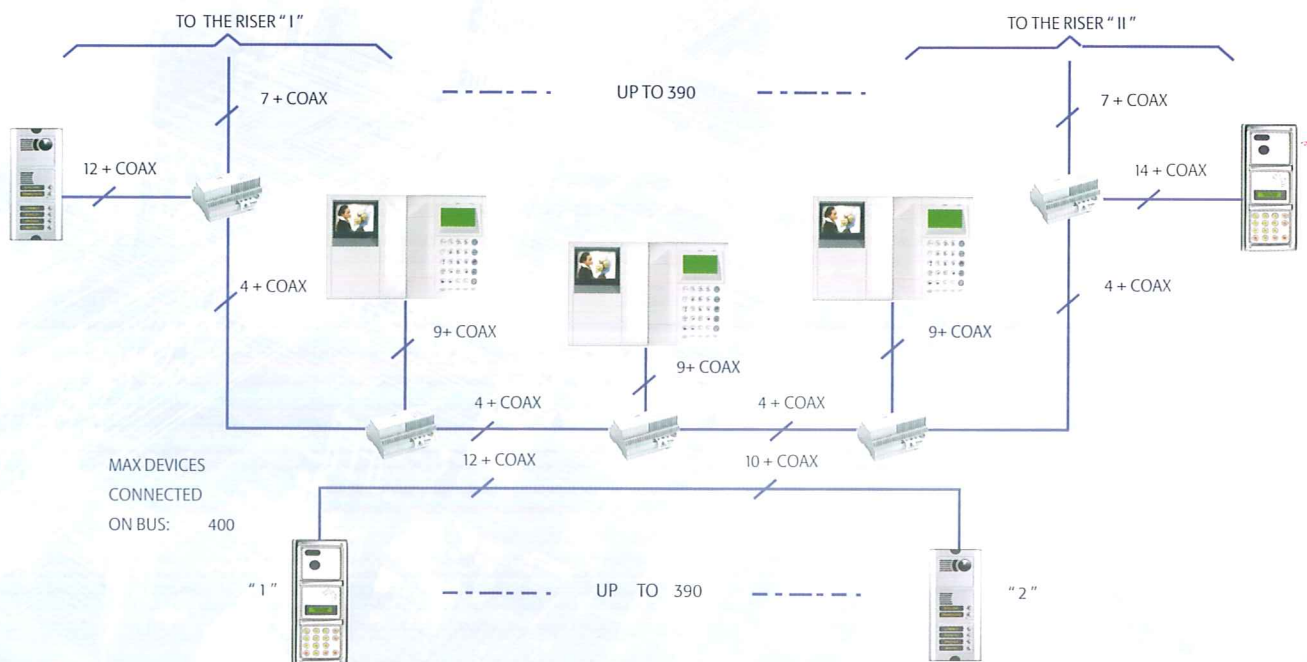

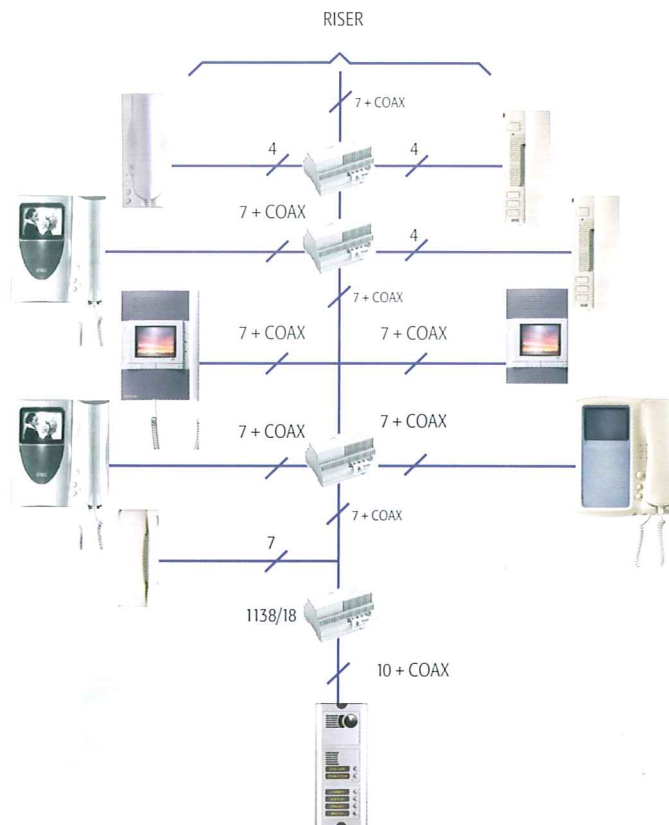

## General Features

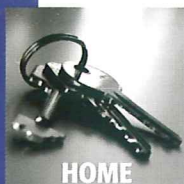

- > The floor call decoders for 4 multiple users are available in three versions, 1038/34, the 1038/35 (both for 4 users) and the 1038/38 (for 8 users). The second and the third models enables creation of video door phone systems while the first is for audio installation only. The 1038/38 get possible to manage the lift control also.
- > The 1038/56 programming terminal allows decoder and call module programming. The latter can also be achieved centrally using the 1038/90 passive wiring socket. It has a backlit LCD display with 4 lines, 16 characters each.
- > The 1082/50 gateway allows to have the main Digivoice backbone and several risers with the simple 2GO! System that can give up to 32 users with only 2 wires not polarized.

## Winning points:

- > Up to 3,5 km of distance and extension
- > Up to 3000 users
- > Up to 5 concierge switchboards
- > Up to 390 entrances
- > Possibility of door opening code for every user
- > Only 9 wires + coax for all the system
- > Possibility of intercom using the 1138/18 housephone
- ...and much more.
