

INTRODUCTION

- This catalogue describes the IKUSI products for reception, processing and distribution of terrestrial, satellite and cable signals in individual and collective installations. It includes IPTV streaming headends for Triple Play (internet-television-telephone) LAN networks.
- The catalogue also presents —section 15— products for implementation of Pay-Per-View services in coaxial collective installations.

GENERAL CHARACTERISTICS

- The nominal RF impedance of all electronic products is 75Ω . Return losses at the RF input and output ports are ≥ 10 dB unless other value is specified.
- Unless notified, the operative ambient temperature range for these products is -10° to +55° C.
- The TV frequency bands designated as BI, BIII and UHF (BIV-BV) are those of the B-G Europe system. The FM Radio band (BII) comprises the frequencies between 87.5 and 108 MHz, and the DAB band those comprises between 174 and 240 MHz (unless other frequency interval is specified).
- Specifications in this catalogue are typical and they are subject to change without notice.

CE AND DVB MARKINGS

- With the reproduction of the CE mark, IKUSI guarantees the compliance of the products with the appropriate EN 50083-1, EN 50083-2 and EN 60065 european standards of the European Committee for Electrotechnical Standardization (CENELEC).
- Likewise, with the reproduction of the DVB mark IKUSI guarantees the compliance of the products with the DVB standards. DVB is a registered trademark of the DVB Project.

ENGINEERING CHANGES

- IKUSI, in order to provide its customers with products embodying the latest technological advances, reserves the right to make revisions in current production models. New specifications affected by such changes may not appear in this catalogue.

INDEX

1 - Antennas — Terrestrial and Satellite Reception

- IKP — TV Antennas - BI 7
- IKS , DAB — FM (BII) and DAB Antennas 7
- INT — TV Antennas - BIII 7
- SGF , UCF , INU , PA , KSG — TV Antennas - UHF 8/9
- CAU — Antenna Connecting-Box UHF Preamplifiers 9
- Masts, Supports, Pylons 10/11
- RPA — Satellite Dishes 12
- Supports for Satellite Dishes 12
- UEU — LNBs - Quattro and Universal 13

2 - Mast-Head Preamplifiers

- SBA — Multiband Preamplifiers - F Connectors 15
- MBS — Multiband Preamplifiers - F Connectors 16
- MB — Multiband Preamplifiers - Terminal-Clamp Connection 17
- MBA — Multiband Preamplifiers - Terminal-Clamp Connection 17
- MMS , MTS — UHF Selective Preamp. - Terminal-Clamp Connection 18
- APB — +24VDC Power Supply - 2 RF Outputs 19
- JSBA , JMBS — «Preamplifier + Power Supply» Sets 19
- MM — 2-way Band Multiplexers 20

3 - Multichannel and Multiband Headends

- STG — Agile, Amplification&Conversion Modular Equipment 21-26
- SZB — Amplification&Conversion&Modulation Modular Equipment 27-31
- MZB — Amplification Modular Equipment 32/33
- MZ6 — Amplification Modular Equipment 34/35
- CBG — Programmable Terr and Sat Amplification Mini-Headends 36/37
- CBS — Terrestrial Amplification Mini-Headends 38
- CBA — Terrestrial Amplification Mini-Headends 39
- CBM — Terrestrial and Satellite Amplification Micro-Headends 40
- AFI — Sat-IF Combiner/Amplifier 41

4 - ClassA Headends

- Range and General Features 43
- SPI - PRG — Programming Accessories 44
- Installation Accessories 45
- HPA — 47-862 MHz RF Power Amplifiers 46
- CFP — Power Supplies 46
- HMS — Control Units 47
- TPC — Terrestrial&Cable TV-Channel Processors 48/49
- TRF — FTA Digital Terrestrial-TV Receivers 50/51
- TDC — Digital Terrestrial-TV Receivers with Embedded CA 52/53
- TDI — COFDM-QAM Transmodulators 54/55
- SRF — FTA Digital Sat-TV Receivers 56/57
- SDC — Digital Sat-TV Receivers with Embedded CA 58/59
- SRC — Digital Sat-TV Receivers with Common Interface 60/61
- MDI — QPSK-QAM Transmodulators 62/63
- CRF — FTA Digital Cable-TV Receivers 64/65
- CDC — Digital Cable-TV Receivers with Embedded CA 66/67
- CRC — Digital Cable-TV Receivers with Common Interface 68/69
- CGT — QAM-QAM Regenerators 70/71
- MCP — VSB TV Modulators 72/73
- HPA — Sat-IF Combiner/Amplifier 74
- AMX — Active Combiner - 4-way, 47-862 MHz 75

5 - ClassB Headends

- Range and General Features 77
- SPI - PRG — Programming Accessories 78
- CFK — Power Supply 79
- Installation Accessories 79
- TDF — FTA Digital Terrestrial-TV Demodulators 80/81
- SDF — FTA Digital Sat-TV Demodulators 82/83
- SDE — Digital Sat-TV Demodulators with Embedded CA 84/85
- CMK — VSB TV Modulators 86-88

6 - LANTV® (Television on IP Networks)

- Range and General Features 89
- TNS — DVB-T to IP Streaming Modules 90
- SNS — DVB-S to IP Streaming Modules 91

7 - Fibre Optics

- FTD — TV + SAT-IF Optical Transmitting Modules 93
- FSP — Optical Splitting Modules 93
- FRD — Compact TV + SAT-IF Optical Receivers 94
- FTR — Compact Return Path Optical Transmitters 95
- FRR — Return Path Optical Receiving Modules 96
- FKH — Distribution and Splice Kits - "Headend" Site 97
- FKR — Distribution and Splice Kit - "Node" Site 97
- Optical Fibre Cables and Jumpers 97

8 - SAT-IF Multiswitches

- Application and Range 99
- RC — Cascadable Multiswitches Equipment 100-108
- MS — Stand-Alone Multiswitches 109
- RS — Stand-Alone Multiswitches 110

9 - Extension Amplifiers — Apartment Amplifiers

- TAE-500 — Two-way, 862 MHz Extension Amplifiers 111
- TAE-700AR — Two-way, 862 MHz Extension Amplifiers 112
- TAE-900 — Two-way, 862 MHz Extension Amplifiers 113
- TAE-700 — Two-way, 862 MHz Extension Amplifiers 114
- TAE-200 — One-way, 862 MHz Extension Amplifiers 115
- SAE-910 — Two-way, 2150 MHz Extension Amplifiers 116
- SAE-820 , SAE-920 — One-way, Double 2150 MHz Ext. Amplifiers 117
- ACP-425 — AC Power Supply 118
- TAE-300 — Two-way, 862 MHz Apartment Amplifiers 119
- ATP-900 — Two-way, 2150 MHz Apartment Amplifiers 120
- ATP-300 — One way, 862 MHz Apartment Amplifiers 121
- ATB-100 — One way, 862 MHz Apartment Amplifiers 122

10 - Line and Distribution CATV Amplifiers — Return TV Modulators

- TAL — Configurable Line and Distribution Amplifiers 123-126
- TSI — AC Power Supply/Power Inserter - RF Configurable 127
- MVR — Return VSB TV Modulator 128

11 - Distribution Elements

- DLS — Indoor Tap-offs - 1000 MHz 129/130
- UDL — Indoor Tap-offs - 2300 MHz 131/132
- DVS — Indoor Splitters - 1000 MHz 133
- UDV — Indoor Splitters - 2300 MHz 133
- CIS , SIS , IIS — Indoor, Divers - 2150 MHz 134
- RLDC , RLS , RPI , GS — Outdoor, Divers - 1000 MHz 135-137
- RMT — Outdoor Tap-offs - 1000 MHz 138/139
- ARTU — Wall Outlets (TV - RD) 140
- ARTU — Wall Outlets (TV/RD - SAT) 141
- ARTU — Wall Outlets (TV - RD - SAT) 142

12 - Coaxial Cables and Connectors

- Indoor Distribution Cables 143
- CATV Trunk&Feeder Cables 144
- Cable Connectors 145

13 - Rack Cabinets — Electronic Accessories

- 19" Rack Cabinets — "Top Line" 147
- 19" Rack Cabinets — "Standard Line" 148
- Plug-in Electronic Accessories - 862 MHz 149
- Electronic Accessories - 862 MHz 150
- Electronic Accessories - 2150 MHz 151

14 - User's Equipment — Measuring Equipment

- MAW — Home DSB TV Modulator 153
- DSA — Signal Analysers 154/155

15 - Pay-Per-View

- vHOTEL — PPV System for Hotels 157-161

16 - Technical Annex

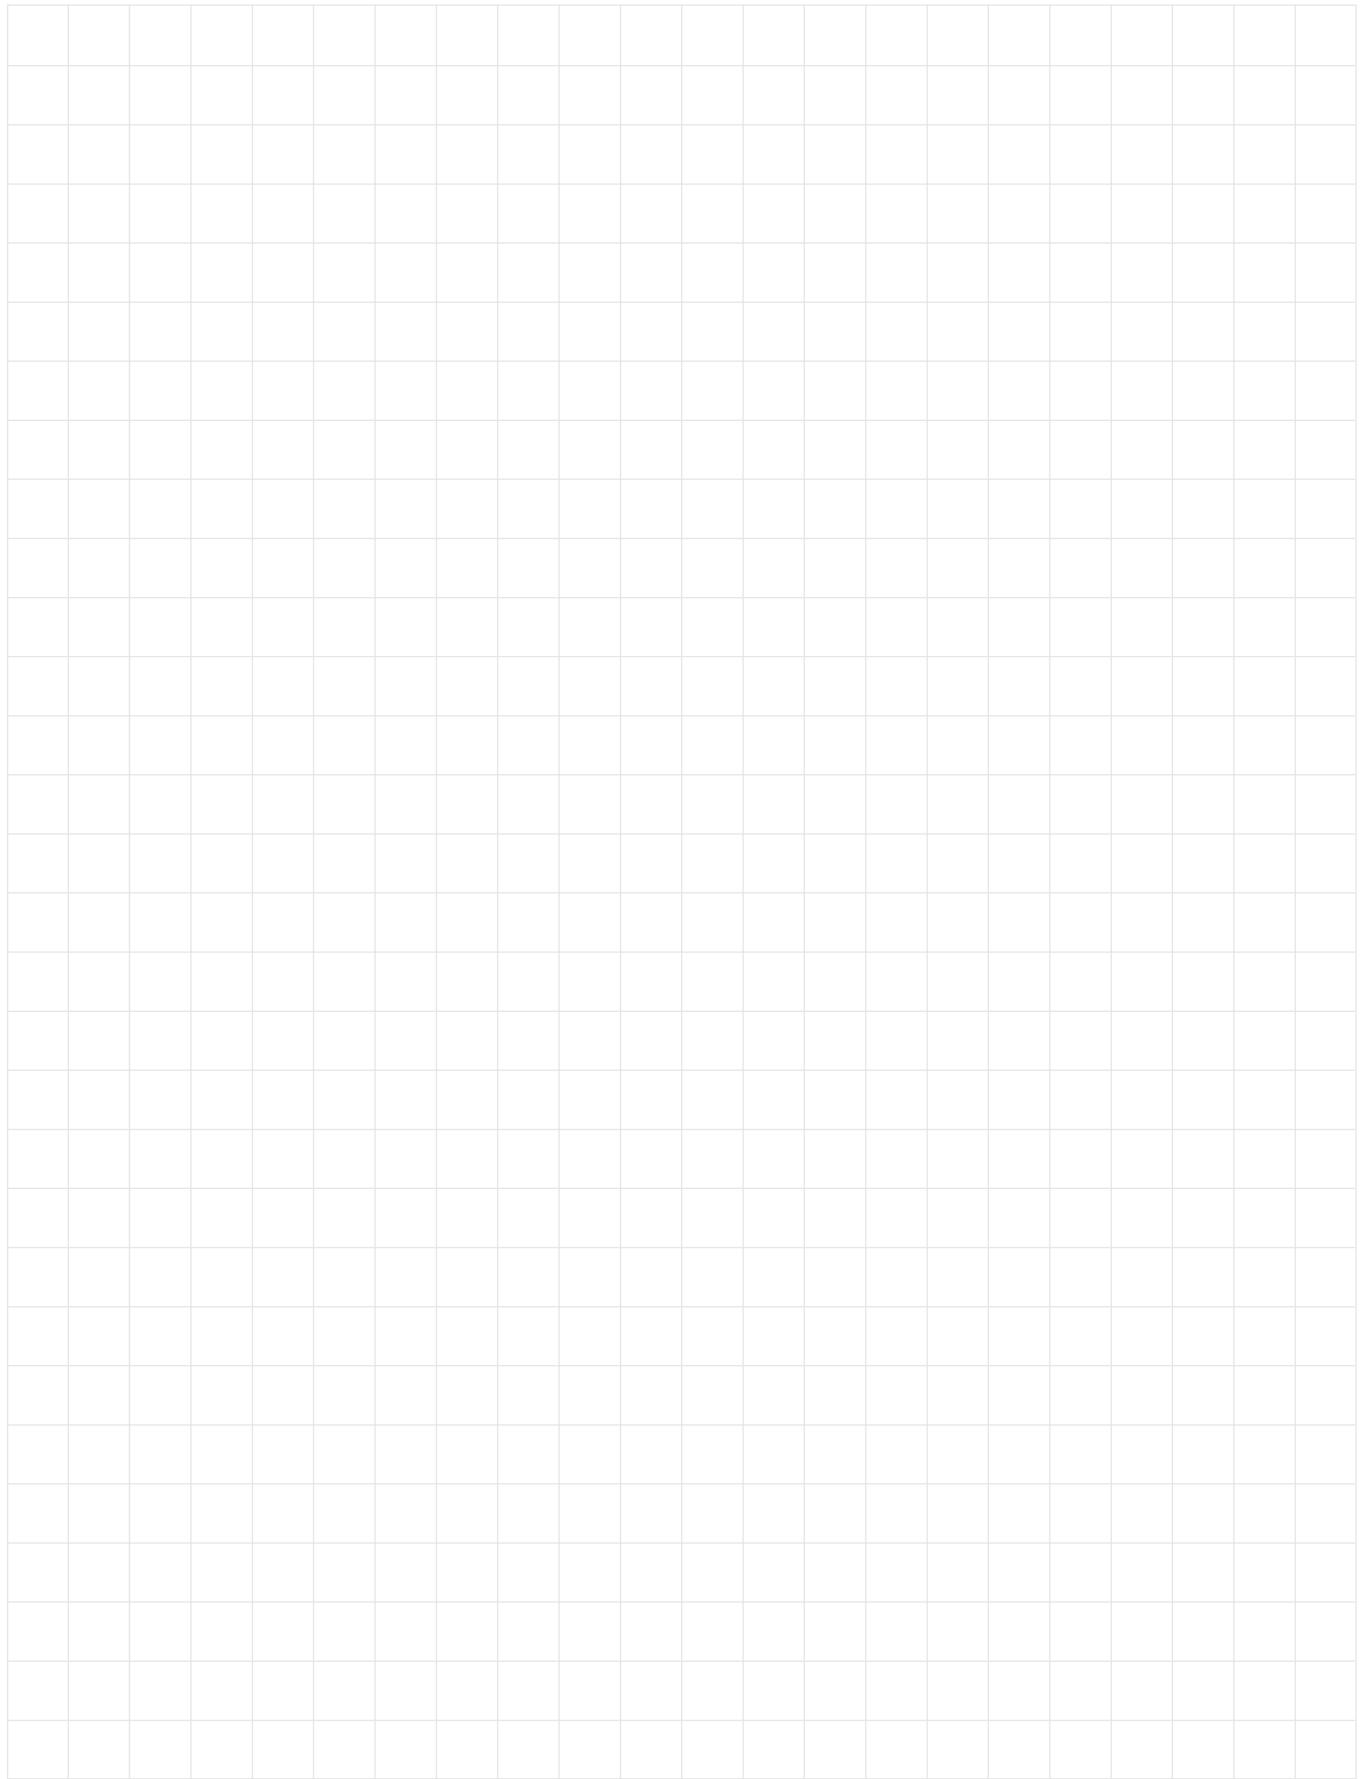

- World Analog TV Standards 163
- TV Channel Allocation 164-167
- Diverse Technical Information 168/169

► ANTENNAS — TERRESTRIAL RECEPTION

TV and Radio Antennas — VHF Band

- Elements and support square-bars made of aluminium.
- Pre-assembled. Clamping system for masts of Ø25 to 50 mm. Variable clamp tilt: +23° to -10° (BI and FM antennas), ±30° (BIII) and 0° to +30° (DAB).
- Terminal-clamp connection.
- Polystyrene connecting-box with weatherproofing IP55 grade.
- Impedance: 75Ω. Specified gain is relative to a dipole; add 2.18 dB to obtain the isotropic gain.

TV antennas - BI

Model	Ref.	Channel	Type	Gain dB	Front-to- back ratio dB	Beamwidth H° V°		Windload for velocities 130/150 km/h N	Connection	Quantity boxed

► ANTENNAS — TERRESTRIAL RECEPTION

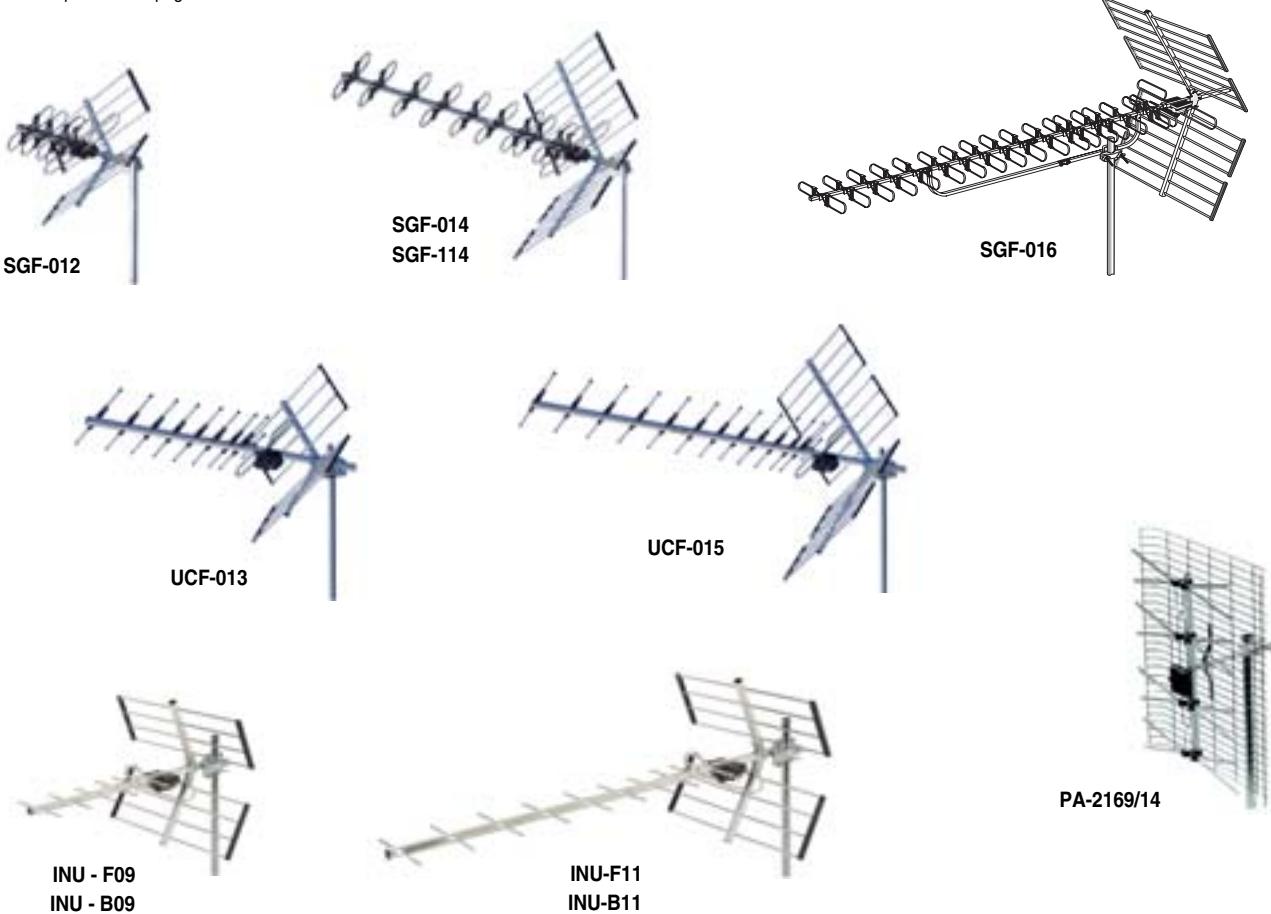

TV Antennas — UHF Band

- Elements and support square-bars made of aluminium.
- Pre-assembled (except KSG models). Clamping system for masts of Ø25 to 50 mm. Variable clamp tilt: 0° to +30°.
- Cable connection: F connector or terminal-clamp.
- Polystyrene connecting-box with weatherproofing IP55 grade. The box is detachable for easy connection of the coaxial cable. Preamplifiers available (see next page).
- Impedance: 75Ω. Specified gain is relative to a dipole; add 2.18 dB to obtain the isotropic gain.

Model	Ref.	Channels	Type	Nominal gain ⁽¹⁾ dB	Front-to-back ratio dB	Beamwidth H° V°		Windload for velocities 130/150 km/h N	Connection	Quantity boxed
SGF-012	1731	21 - 69	COLLINEAR λ (1 dihedral reflector)	12	≥ 20	44	35	59 / 80	F connector	10

INU-B09	1737	21 - 69		9	≥ 20	55	57	44 / 60	Terminal-clamp	10
INU-B11	1738	21 - 69		11	≥ 20	40	50	52 / 71	Terminal-clamp	10
PA-2169/14	1692	21 - 69	4 COL. DIPOLES (1 panel reflector)	14	≥ 25	39	26	102 / 140	Terminal-clamp	4

- Usable for horizontal or vertical polarization (only horizontal in model SGF-016).
- Models with F type connection are supplied with 1 screw-on F plug and 1 rubber protection cap.

⁽¹⁾ See Gain Graphs on next page.

► ANTENNAS — TERRESTRIAL RECEPTION

TV Antennas — UHF Band

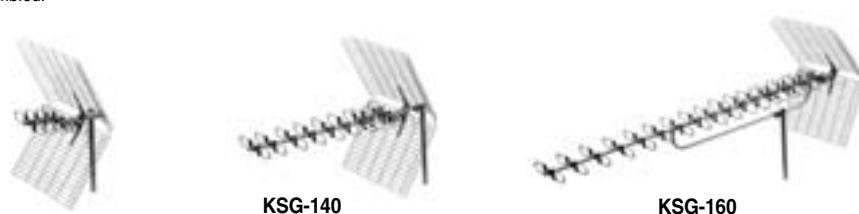

(cont'd)

TV-UHF antenna KITS

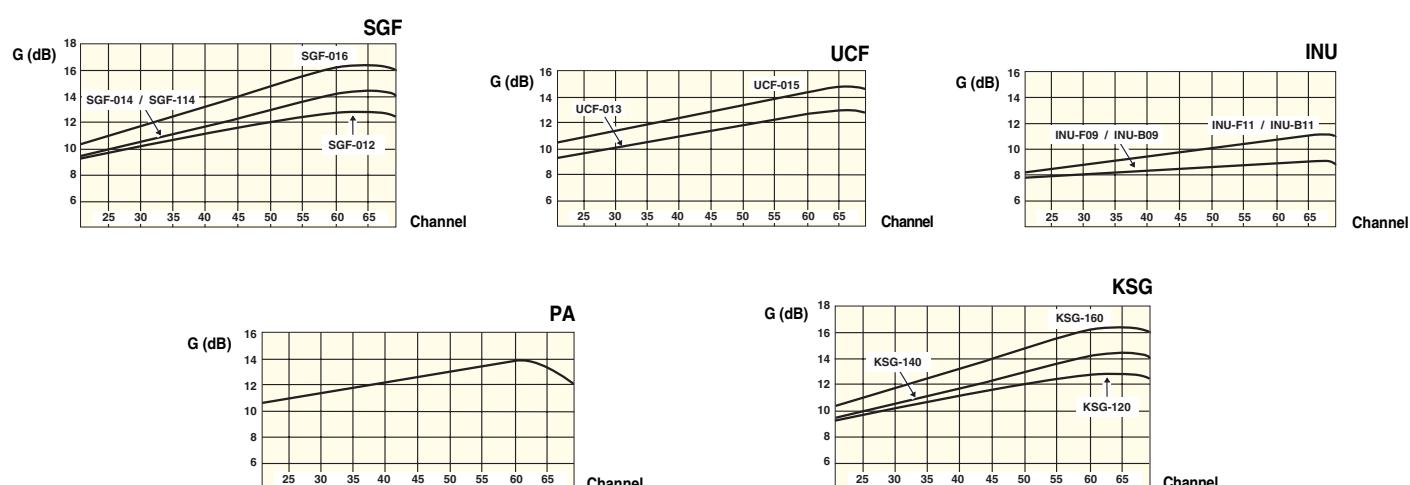

Model	Ref.	Channels	Type	Nominal gain ⁽¹⁾ dB	Front-to-back ratio dB	Beamwidth H° V°	Windload for velocities 130/150 km/h N	Connection	Quantity boxed
KSG-120	1696	21 - 69	COLLINEAR λ (1 dihedral reflector)	12	≥ 25	44 35	59 / 80	Terminal-clamp	10
KSG-140	1695	21 - 69		14	≥ 25	30 29	85 / 116	Terminal-clamp	7
KSG-160	1697	21 - 69		16	≥ 25	23 22	133 / 182	Terminal-clamp	4

- Economical. The antennas are supplied wholly disassembled.

⁽¹⁾ See Gain Graphs below.

Gain Graphs of UHF Antennas

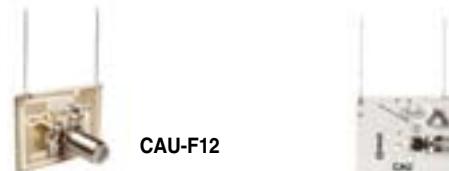

Antenna Connecting-Box UHF Preamplifiers

- Two models, for F type or terminal-clamp connection. Model with F-type connection is fitted in the connecting-box of SGF, UCF and INU antennas. Model with terminal-clamp connection may be fitted in the connecting-box of any UHF antenna —IKUSI and other brands— that have this type of connection.

Model	Ref.	Connection	Bandwidth MHz	Gain dB	Noise figure dB	Operating voltage ⁽¹⁾ VDC	Consumption mA	Output level ⁽²⁾ dB μ V	Dimensions mm

Masts

Plug-in Masts

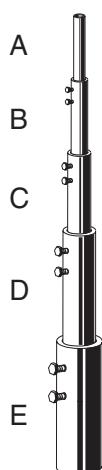

Ref.	Length m	Diameter mm	Thickness mm	Max permissible Bending Moment N·m	Intrinsic Moment * for wind velocities 130/150 km/h N·m	Useful Bending Moment * for wind velocities 130/150 km/h N·m
1941	3	40	1.5	395	60 / 82	335 / 313
1880	2.5	35	1.5	298	46 / 63	252 / 235
1881	1.5	35	1.5	298	13 / 18	285 / 280
1885	2.5	30	1	150	31 / 42	119 / 108

* A clamped-in length equals $1/6 L$ is taken on.

- Pluggable for double configurations.
- Material: zinced, quality S235JR (EN 10025) steel.
- For anchorage on Ø30 and 35 mm use the rope-bracing Ref. 1916 (next page).

Double configurations	Intrinsic Moment * v = 130/150 km/h N·m
1941 + 1941	235 / 321 N·m
1880 + 1880	180 / 246 N·m
1885 + 1885	121 / 164 N·m
1880 + 1881	109 / 149 N·m

Telescopic Masts

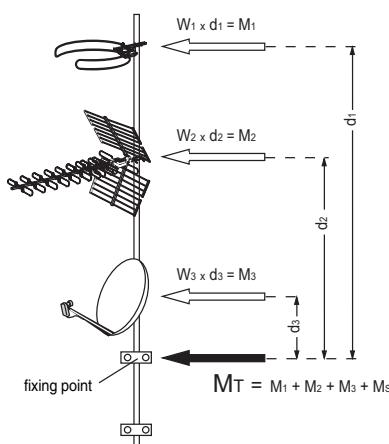

Ref.	Section	Length m	Diameter mm	Thickness mm	Max permissible Bending Moment N·m	Intrinsic Moment for wind velocities 130/150 km/h N·m
1934	A	3	25	1.5	144	54 / 74
1935	B	3	30	1.5	213	64 / 88
1936	C	3	35	1.5	298	75 / 103
1937	D	3	40	1.5	395	86 / 118
1938	E	3	45	1.5	505	97 / 133

- Easy mounting. Heights of up to 14.2 m.
- Material: zinced, quality S235JR (EN 10025) steel.
- For anchorage on Ø30 and 35 mm use the rope-bracing Ref. 1916 (next page).

Configurations possible

Max useful length	14.2 m	11.4 m	8.6 m	5.8 m	3 m
Sections to be used	A+B+C+D+E	A+B+C+D	A+B+C	A+B	A

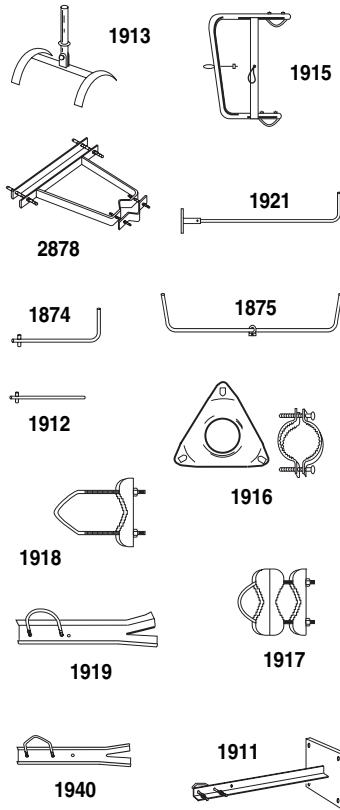

$W_{1,2,3}$ = Windloads of the antennas
 $M_{1,2,3}$ = Bending Moments because each antenna
 Ms = Intrinsic Moment of the mast
 MT = Total Bending Moment at the fixing point

- Calculation of the MT Bending Moment at the fixing point of a mast with several antennas

► ANTENNAS — TERRESTRIAL RECEPTION

Supports

- General material: zinced, quality S235JR (EN 10025) steel.

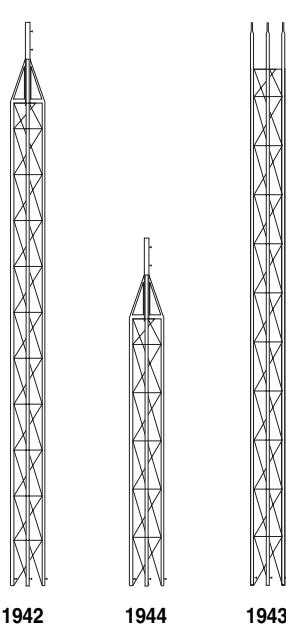

Ref.	Description
1913	Tilttable ridge-tale base for Ø30 to 35 mm masts.
1915	Chimney support for Ø≤45 mm masts.
2878	Bracket set for distant wall-mounting of Ø≤45 mm masts.
1921	Window angled bracket. Length: 85 cm; Ø25 mm.
1874	Off-centre single-angled bracket for Ø≤45mm masts. Pipe: Ø25/22mm. Hor. length: 80cm; Vert. length: 25 cm
1875	Off-centre double-angled bracket for Ø≤45mm masts. Pipe: Ø25/22mm. Hor. length: 120cm; Vert. length: 25 cm
1912	Off-centre straight bracket for Ø≤45mm masts. Pipe: Ø25/22mm. Length: 50cm
1916	Rope-bracing set for Ø30 to 35 mm masts.
1918	Rail clamp for Ø≤45 mm masts.
1917	Double rail clamp for Ø≤45 mm masts.
1919	Wall reinforced clamp, length 40 cm. For Ø≤45 mm masts.
1940	Wall 26P clamp, length 25 cm. For Ø≤40 mm masts.
1911	GMA-400. Wall-screwing clamp, length 40 cm. For Ø≤45 mm masts.
1920	Tensioner 1/4". Adjustable length: 16 to 22 cm.
1923	Enclosed cable clip.

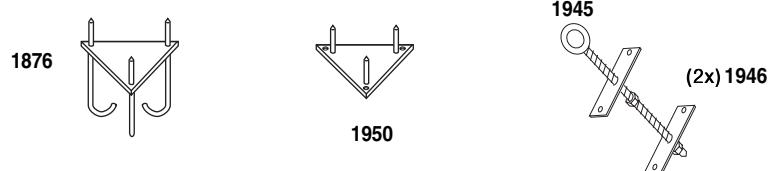

Pylons

- Made from Ø20 mm pipe and Ø6 mm lattice-road. Three available sections with joining ends to facilitate coupling when building high towers.
- Material for pylons and accessories: zinced, quality S235JR (EN 10025) steel.

Ref.	Description
1942	Trestle-tower or upper section, 2.5 m. Top end adapted for housing the Ref. 1941 point mast (see previous page).
1944	Trestle-tower or upper section, 1.5 m. Top end adapted for housing the Ref. 1941 point mast (see previous page).
1943	Lower section, 2.5 m. To be coupled to an upper section or to be used as intermediate section. Resulting trestle-tower requires rope-bracing.
1876	Hooked, triangular fixed base, side 225 mm. Three bolts for securing the trestle-tower.
1950	BTA-225. Screwed, triangular fixed base, side 225 mm. Three bolts for securing the trestle-tower.
1945	AMA-112. M14 rod for rope-brace anchoring. Length: 380 mm. Ring: Ø48 mm.
1946	AMA-111. Plate 200 x 50 mm for rope-brace anchoring.
1948	Steel wire Ø3 mm for rope-bracing use.

Satellite Dishes — Offset Type

- Made up of: a) Dish made of powder-coated steel, b) LNB arm made of aluminium, c) LNB holder made of polypropylene and fibre glass, and d) Az-EI holder made of galvanized steel, with 2 U-bolts and 2 mast clamps.
- Precision mechanical construction.
- Supplied in individual box or industrial packings of 30, 200 or 400 units.

► MULTICHANNEL HEADENDS

«STG» — Agile Multichannel Equipment

CE

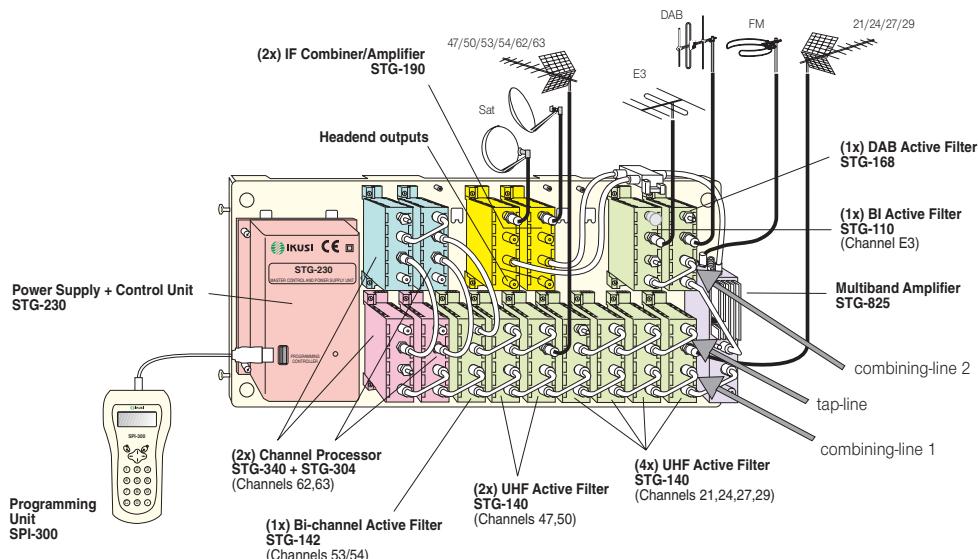

The STG Headend System is a totally new concept aimed at medium sized SMATV installations. Its super compact design, frequency agility and simplicity make this product a real winner with the installer, as it allows for total flexibility and expandability. An STG Headend can be configured precisely to the exact requirements of the installation and can be further expanded at a later date by simply adding "stock" modules. The whole system is easily assembled and instantly "tuned" on site by the technician as required.

Based on a small wall mounting baseplate, which can be mounted in a very confined space, the STG utilizes 'Agile Active Filter' preamplification modules and 'Agile Channel Processor' conversion modules for Terrestrial TV reception. Dependent on the final requirement of the system a choice of 2 final drive 'Multiband Amplifier' modules has been created. The installer can therefore configure the final output driver by using either the Push-Pull or the higher powered GaAs FET Multiband Amplifier Module. The channel processors, each one composed of 2 independent modules (down-converter and up-converter), have main application for areas which have adjacent channels requirements; for this application the choice of multi-channel modules have also been made available. For Satellite IF Distribution requirements, the system offers a 'Sat-IF Combiner/Amplifier' module.

With the exception of the manual gain control on the Multiband Amplifier, the remaining adjustments of the STG headend can be carried out through an SPI-300 Programming-Unit which is connected through an USB port on the 'Power Supply + Control Unit' module. These functions include:

- Required channel or frequency settings & alignment,
- Gain of the active filter modules and channel processors,
- Gain of the Satellite IF combiner/amplifier,
- LNB voltage & tone settings.

The address of each module is simply determined by its location on the baseplate. The parameters set are controlled by microprocessor and remain unalterable, unless they are modified through an SPI-300. For additional ease of use, the SPI-300 allows a bank of 500 preset memorized settings to be stored on board. This for example could include all the Terrestrial TV channels of the area, which in turn, allows the technician to quickly load repetitive information on several headend installations.

— Example of STG headend for 1 x BI channel, FM band, DAB band, 10 x UHF channels (2 are adjacent analogs and 2 are adjacent analog+digital) and 2 x Sat-IF signals.

- The control signals and operating voltages provided by the 'power supply + control unit' module are transferred through the bus integrated in the baseplate.
- The agile active filter and channel processor modules feature two directionally coupled input and output ports. Signal can therefore be directly fed into the input port of the first module which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel combining. The sum of the combined channels is then connected in the same way to the final drive amplifier, which then feeds the distribution network.
- The output of the final drive amplifier can alternatively be fed through the Sat-IF combiner/amplifier module if the requirement calls for a combined Satellite/Terrestrial SMATV distribution. Two separate trunks can also be launched if the need for separate Sat IF feeds are called for.
Important: In a headend with 2 outputs the terrestrial signal is identical in both trunks, but the Sat IF signal is different and corresponds to the respective satellite signal or the polarization selected in each of the 2 Sat-IF combiner/amplifier modules installed.
- An extension input port on the STG-825 Multiband Amplifier module is available to allow the coupling of an external RF signal from an IKUSI «TRF», «SAI», «SRF» or «MDI» headend.
- Operating temperature range: 0° to +45° C.

- The following components form part of the STG system:

Baseplate	BAS-120
Rack-frame	SMR-120
Power Supply + Control Unit	STG-230
Agile Active Filter — BI, BIII, UHF single-channel	STG-1x0
Agile Active Filter — UHF 2-channel	STG-142
Agile Active Filter — UHF 4-channel	STG-50x
Active Filter — DAB	STG-168
Down-Converter (TV channel to IF)	STG-3xx
Up-Converter (IF to TV channel)	STG-30x
45-862 MHz Multiband Amplifier, 120 dB μ V	STG-820
45-862 MHz Multiband Amplifier, 125 dB μ V	STG-825
Sat-IF Combiner/Amplifier	STG-190
Housing	COF-120
Programming-Unit	SPI-300

— There is no need for an FM active filter module. The FM radio reception signal can be directly connected to the multiband amplifier.

— When a headend is configured with 2 x STG-190 modules (as shown in the above diagram), an additional 2-way splitter is required, such as a DVS-204 (page 133), to share out the output terrestrial signal from the final drive amplifier to each of the two Sat IF modules.

► MULTICHANNEL HEADENDS

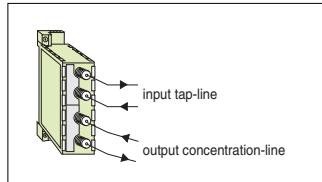

«STG» — Agile Active Filters

- Reception of terrestrial TV (bands I, III and UHF) and DAB Radio.
- Zinc alloy housing, measuring 90x82x30 mm. F type connection. Fixed on the BAS-120 baseplate with 2 built-in screws.
- Two directionally coupled input ports to easily distribute the incoming signal, and two similar output ports to combine the various outputs, without the need of additional external passive devices.
- TV channel frequency and gain adjustments easily carried out on site using the SPI-300 programming-unit. Automatic level equalization of the VHF and UHF wideband signals fed into the final drive amplifier STG-82x.
- Two F plug bridges are supplied with each module, for input and output linking.

«STG» — Agile Channel Processors

- Heterodyne, SAW filtered double conversion, for reception of terrestrial programmes in bands I, III and UHF. Application as Channel Converters (output channel is different to input channel) or Channel Processors (output channel is the same as input channel), the last ones operating as high-selectivity single-channel amplifiers appropriate for areas which have adjacent digital and/or analog channel requirements.
- Two independent modules required, one STG-3xx down-converter (conversion from input channel to IF) and one STG-30x up-converter (conversion from IF to output channel), interconnected by a coaxial link. Zinc alloy housings, measuring 90x82x30 mm. F type connection. Each module is fixed on the BAS-120 baseplate with 2 built-in screws.
- Two input ports in the down-converter and two output ports in the up-converter, with directional couplings to easily distribute the incoming signals and combine the various outputs, without the need of additional external passive devices.
- TV channel frequencies, tuning offset and gain adjustments easily carried out on site using the SPI-300 programming-unit. Automatic level equalization of the VHF and UHF wideband signals fed into the final drive amplifier module STG-82x.
- One F plug bridge is supplied with each module, for input and output linking.

1 Analog Channel plus 1 Digital Channel	2 Channel Processors or 1 STG-142 Active Filter (if digital level is ~10 dB lower than analog level)
4 Analog or Digital Channels	1 STG-504/505 Active Filter (if digital levels are ~10 dB lower than analog levels, these last being levelled)

► MULTICHANNEL HEADENDS

«STG» — 45-862 MHz Multiband Amplifiers

- Final Drive Amplifiers to launch the TV and DAB signals from the agile active filters and processors. Feature a direct input for the FM Radio signal from the antenna. Two models are available using two types of amplification technology and output levels. STG-820 with push-pull technology (120 dB μ V) and STG-825 with advanced GaAs FET Drivers delivering a maximum of 125 dB μ V.
- Manual gain adjustment.
- Zinc alloy housing. F type connection. Fixed on the BAS-120 baseplate with 2 built-in screws.
- The STG-825 features an *extension input* port which allows the coupling of a further RF signal source from an existing «TRF», «SAI», «SRF», «MDI» or «TDI» headend.
- Two F plug-bridges are supplied for connection to combining lines 1 and 2 of the STG headend.

Dimensions	mm	90 x 82 x 30	150 x 82 x 30

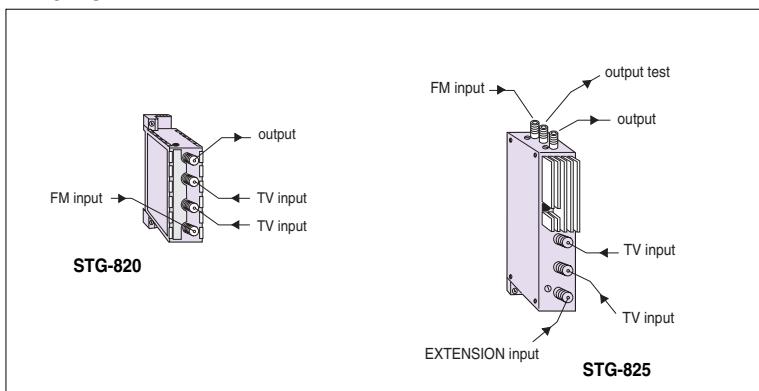

Notes

¹ Output level for BI, BIII and UHF signals, IMD3= -60 dB (DIN 45004B), applicable for amplification of 2 TV-channels. If more than 2 channels are used, see Reduction Table on page 168 (Technical Annex).

DIGITAL TV SIGNALS: If output levels of digital TV channels and DAB and FM radios are set 10 dB or more below those of the analog TV signals, they can be ignored when calculating the output reduction level. On the other hand, if these levels are set at the same level as those of the analog TV channels, they must count as normal channels and the amplifier's output level must be de-rated accordingly.

² Output level for Radio FM signals, IMD3= -50 dB (2 carriers).

RF PORTS

► MULTICHANNEL HEADENDS

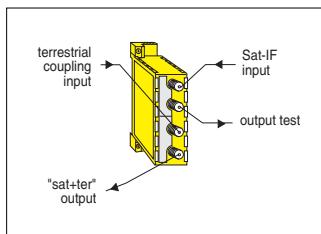

«STG» — Sat-IF Combiner/Amplifier

- Reception of satellite TV programmes.
- Zinc alloy housing, measuring 90x82x30 mm. F type connection. Fixed on the BAS-120 baseplate with 2 built-in screws.
- 1 x Satellite 950-2150 MHz input port, with adjustable gain and pre-emphasized response to compensate for cable losses; 1 x Terrestrial coupling 44-862 MHz input port; 1 x Combined Satellite+Terrestrial output port; 1 output test port.
- Able to power the LNB attached. Generates the required voltage/tone signals for the selection of the H/V polarisation and high/low frequency sub-band.
- Gain and voltage/tone settings through the SPI-300 programming-unit.

STG-190

BAS-120

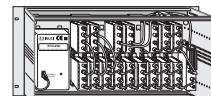

COF-120

Model	Ref.	Description
BAS-120	2808	Baseplate. Capacity: 20 modules (1 power supply+control unit, 1 multiband amplifier and maximum 18 active filters or converters —17 or 16 when 1 or 2 IF combiner/amplifier are installed). Includes a 12-line bus and 21 DIL sockets for transporting and connecting the power and control signals. Dimensions: 450 x 210 mm. Wall fixing.
COF-120	2810	Housing for 1 BAS-120 base-plate. Dimensions: 438x280x150 mm. Indoor mounting. Metallic. Closing system.
SMR-120	2835	Rack-frame with built-in BAS-120 baseplate. 6U height. Overlay included to finish the assembly. Easy integration in standard 19" racks.
DVS-204	3336	Two-way 1000 MHz splitter (see specifications on page 133). Required when two STG-190 are installed.
CTF-175	1519	75Ω F load plug. To terminate spare input and output ports on the active filters and processors.

SMR-120

STG headend mounted in the SMR-120 rack-frame (rear view)

ORDERING INFORMATION

When ordering an STG headend please note the following :

ALWAYS...

- 1 x BAS-120 Base-plate or SMR-120 Rack-frame
- 1 x STG-230 Power Supply & Control Unit
- 1 x STG-820 or STG-825 Multiband Amplifier
- 1 x SPI-300 Programming-Unit
- 1 x COF-120 Housing (optional)

FOR TERRESTRIAL RECEPTION...

- 1 x STG-110 Active Filter for each BI channel.
- 1 x STG-130 Active Filter for each BIII channel.
- 1 x STG-140 Active Filter for each UHF channel.
- 1 x STG-168 Active Filter for DAB band.

If adjacent channels are received, use either processors or multichannel filters in accordance with criteria pointed in the table at the bottom of page 23.

FOR IF SATELLITE RECEPTION...

- 1 x STG-190 Combiner/Amplifier for each LNB output.
- 1 x Two-way splitter (DVS-204), only required if 2 x STG-190 modules are installed.

AND THE FOLLOWING ACCESSORIES...

- F bridges. 2 are supplied with each active filter, each multiband amplifier. 1 is supplied with each converter.
- 1 or 3 F coax links (approx 25 cm), depending on whether 1 or 2 STG-190 modules are required.
- 1 coax link (or F bridge, depending on the arrangement of the conversion modules) per processor installed.
- 75Ω F terminations.

► MULTICHANNEL HEADENDS

«SZB» — Amplification, Conversion and Modulation Equipment

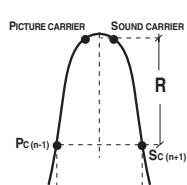

CE

3

- Amplification, Conversion and Modulation modules, dimensions: 190x38x87 mm. F connection. Easy to assemble onto the wall mounting base plates, without the need of any tools.
- TV single-channel and multichannel amplifiers, the last ones especially created for amplification of combined analog and digital channels. Z input demultiplexing and Z output multiplexing. Adjacent channel operation allowed in UHF band.
- FM Radio and DAB Amplifiers.
- PLL-controlled converters. Z input demultiplexing. Within a headend, each converter module must be complemented with an amplifier module.
- Sat-IF Combiner/Amplifier.
- Double Side Band programmable TV modulators.
- Power Supply modules, dimensions: 215x35x140 mm. Output voltage +24 VDC is automatically connected to the RF modules through a connecting bar at the base-plate.
- It is advisable to place the amplifiers on the base-plate following an increasing order of number of channel (frequency). The RF output of the headend will be taken from the last one of the modules ordered in this way (see application example below).

«SZB» — Amplification, Conversion and Modulation Equipment

(cont'd)

Programmable TV Modulators

- Double Side Band. Mono Audio.
- Microprocessor controlled. Access to adjustments and programming can be easily achieved through the SPI-300 programming-unit, see below.
- Built-in test pattern generator.
- Designed to deliver a very low broadband noise floor so several SZB-400's can be simply combined together through the two directional RF output ports provided, then fed into a broadband amplifier as the final driver. Only 1 channel gap required.
- One single channel RF output from each modulator, or one multichannel RF output by installing the concentration line. The free output ports need to be terminated using a 75Ω terminator.

► MULTICHANNEL HEADENDS

«MZ6» — Amplification Equipment

CE

- Single-channel and multichannel active and passive Filter Modules. The multichannel modules have been especially created for amplification of combined analog and digital channels. Adjacent channel operation allowed in UHF band. Also FM Radio and DAB active and passive filters. Dim.: 140x37x70 mm. F connection. Simply to place, without any tool, onto wall-fixing base-plates. Z input demultiplexing and Z output multiplexing. The Z concentration line to be used as RF signal source for the *amplifier/power supply/power inserter* module.
- Amplifier/Power supply/Power inserter module, dimensions 80x148x106 mm. Push-pull amplification technology. 1 «RF input + DC output» port and «1 RF output» port. Output voltage +24 VDC is automatically connected to the filters through the Z concentration line.
- It is advisable to place the filters on the base-plate following a decreasing order of number of channel (frequency) starting from the amplifier/power supply/power inserter module. The RF output of the headend will be taken from this aforementioned module (see application example below).
- Easy incorporation —to a new or existing «MZ6» headend— of the SZB-190 Sat IF Combiner/Amplifier (see page 29).

► MULTIBAND HEADENDS

«CBG» — Programmable Terrestrial Amplification Mini-Headend

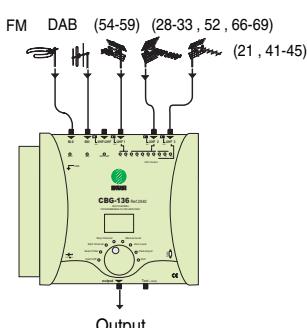

CE

- 6 Inputs (BI/FM - BIII - VHF/UHF - 3x UHF). Programmable frequency response for the three UHF inputs.
- Amplification of up to 10 UHF clusters of 1 to 7 channels bandwidth each. High selectivity of input filtering.
- VHF and UHF frequencies are amplified separately, with option of bridging the first amplification stage (20 dB) in the UHF paths. Gain adjustment in 1 dB steps. Possibility of automatic leveling of UHF cluster signals.
- Easy programming by using one rotary/push button viewed on 2-digit display and LEDs for each cluster and each input. Settings done can be protected against intrusion by using a password to accede the programmation process.
- "COPY" function in order to transfer all settlements from one CBG to another reducing time of installation. Similarly, setting data can be transferred from a "memory module" available for that purpose (see below).
- Feed-through facility on VHF/UHF and UHF inputs (switchable +24 VDC) for remote powering of mast-head preamplifiers.
- Output test port.
- Mains powered, 50/60 Hz. Insertable mains lead, with bipolar plug. Electrical safety protection level: Class II.
- Wall fixing. F type connection. Indoor mounting. Grounding terminal.

«CBS» — Terrestrial Amplification Mini-Headends

CE

- Three series: a) CBS-900 : 120 dB μ V; b) CBS-700 : 117 dB μ V; c) CBS-500 : 112 dB μ V
- 1, 2 or 5 RF inputs — 1 RF output.
- Push-pull technology for 900 and 700 Series. Very low 2nd order intermodulation distortion.
- Variable input attenuators.
- External RF output test F port.
- In 900 and 700 Series, feed-through facility (switchable +24 VDC) on every RF input, except FM, to provide line powering to preamplifiers.
- Mains powered, 50/60 Hz. Electrical safety protection level: Class II. Mains lead with bipolar plug.
- Injection-moulded zinc alloy housing. Access to internal variable attenuators through an easy-to-open frontal panel. F type connection. Wall-fixing.
- Indoor mounting. Grounding terminal.

► MULTIBAND HEADENDS

«CBM» — Terrestrial and Satellite Amplification Micro-Headends

CE

- Designed especially for single-family homes (chalets, villas). Also for small-size collective installations, in cases of only-terrestrial reception.
- Complete range to meet all terrestrial and satellite configuration requirements. Available models with 45-862 MHz "extension" input for combining video/audio modulated sources (surveillance cameras, for example).
- In models with IF input, independent amplification paths for satellite (950-2150 MHz) and terrestrial signals. Sloped response (5 dB) for IF. Direct transit of the LNB remote power coming from the user receiver.
- Adjustment potentiometers on the inputs. Interstage position in UHF amplification for maintenance of low noise figure.
- AC (mains) or DC (+12V / +24V) powering. In the first case (models CBM-1xx), mains lead with bipolar plug. In the case of DC powering (model CBM-685), connection socket at the rear side of the micro-headend.
- Remote powering of mast-head preamplifiers. Insertion of DC voltage by the small plug-in bridges provided.
- Small plastic box, with protective cover. Internal zinc alloy chassis. F type connection.
- Indoor mounting. Wall-fixing.

► ClassA HEADENDS

ClassA Modules — Range and General Features

4

ClassA is a complete range of functional modules for processing of analog and digital terrestrial, satellite, cable and baseband signals. Optical transmitters and receivers. Also IP streamers. All modules have identical format and are simply to place on a wall-fixing baseplate or in a 6RU rack-frame. Connection and control ports are disposed on the front panel.

The range includes the following types of modules:

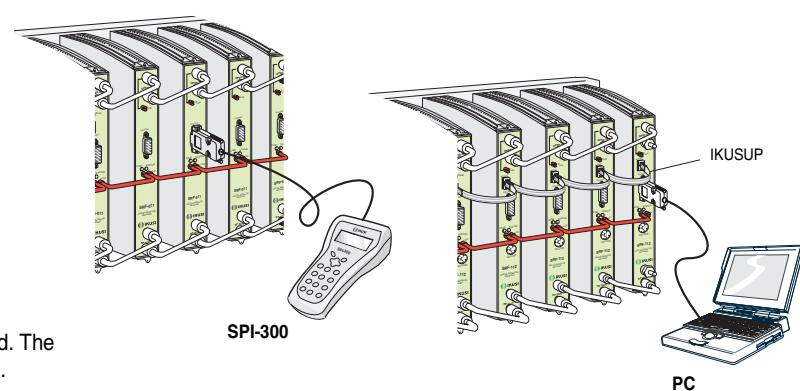

- «TPC» : Terrestrial/Cable TV-Channel Processors (pages 48/49).
- «TRF» : Free-To-Air DVB-T Receivers (pages 50/51).
- «TDC» : DVB-T Receivers with Embedded Conditional Access (pages 52/53).
- «TDI» : COFDM-QAM Transmodulators (pages 54/55).
- «SRF» : Free-To-Air DVB-S Receivers (pages 56/57).
- «SDC» : DVB-S Receivers with Embedded Conditional Access (pages 58/59).
- «SRC» : DVB-S Receivers with Common Interface (pages 60/61).
- «MDI» : QPSK-QAM Transmodulators (pages 62/63).
- «CRF» : Free-To-Air DVB-C Receivers (pages 64/65).
- «CDC» : DVB-C Receivers with Embedded Conditional Access (pages 66/67).
- «CRC» : DVB-C Receivers with Common Interface (pages 68/69).
- «CGT» : QAM-QAM Regenerators (pages 70/71).
- «MCP» : Vestigial Side Band TV Modulators (pages 72/73).
- «HPA» : 47-862 MHz and 950-2150 RF Power Amplifiers (pages 46 and 74).
- «AMX» : 4-way 47-862 MHz Active Combiner (page 75).
- «HMS» : Control Units (page 47).
- «CFP» : Power Supplies (page 46).
- «xNS» : DVB to IP Streamers (pages 89-91).
- «FTD» : Optical Transmitters (page 93).
- «FSP» : Optical Splitters (page 93).
- «FRR» : Optical Receivers —return path (page 96).
- «CTP» : Video Scrambler (page 157).

The family is complemented with accessories for programming and installation (next pages 44 and 45).

PROGRAMMING AND FIRMWARE UPDATE

ClassA modules are locally programmed and adjusted either with the SPI-300 programming unit from IKUSI or with a PC with the PRG-300 software installed. In this second case, a communication bus (IKUSUP) must be installed along the modules using interconnection jumpers. Programming with PC can also be done remotely, through modems, using either the PRG-300 software or simply a web browser if an HMS control unit is installed in the headend. The parameters are controlled in each module by a built-in, powerful microprocessor and remain unalterable unless they are modified with the SPI or PC.

Firmwares of the modules and programming unit can be updated. The corresponding files are downloaded from <http://www.ikusi.com>.

AGILITY AND ADJACENT CHANNELS

ClassA modules feature frequency agility handled by a high-performance PLL heterodyne double conversion. The broadband noise floor generated is exceptionally low, so multiple modules can be installed in the headend with very little deterioration of the CNR. The use of SAW filters provides, on the other hand, a true vestigial sideband response that enables frequency planning using adjacent channels.

These characteristics mean the installations are highly flexible and the maintenance problems are simplified.

VIDEO/AUDIO LOOP AND BISS OPERATION

ClassA receivers have an external video/audio loop that is switchable under control software. So, these receivers can be used in scrambling systems (vHOTEL from IKUSI, for example).

The receivers can also operate in BISS systems (Basic Interoperable Scrambling Systems).

► ClassA HEADENDS

Programming Accessories

SPI-300

Programming Unit

Model	SPI-300
Reference	4070
<ul style="list-style-type: none"> For programming the ClassA modules. Cable connection to the DB-9 front panel socket. 20x4 character alphanumerical display. Numerical and function keys. Microprocessor controlled. User friendly software (selectable language: english, spanish, french). Built-in diagnostic and error identification. Module firmware update. Firmware of the SPI-300 can also be updated through a PC. Capacity of 500 preset memory allocations for repetitive ClassA module configurations. No battery required. Powered through the interface lead (max consumption: 150 mA). DC jack to connect a +15 VDC voltage from an auxiliary power supply when updating the internal firmware through a PC. Dimensions: 160x75x40 mm. 	

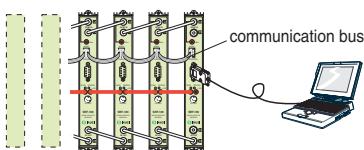

PRG-300

PC Software for Local and Remote Programming

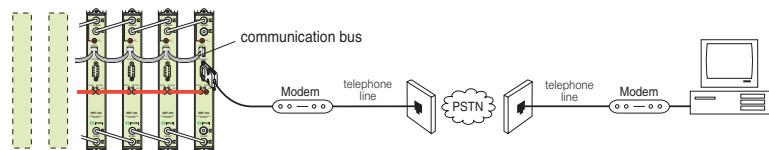

Model	PRG-300
Reference	9602
<ul style="list-style-type: none"> For programming and monitoring the ClassA headends from a PC, either locally or remotely via modem. Operation language (spanish, english) is automatically established in concordance with that used in Windows. Windows-based graphical interface. Use of preset memory allocations for repetitive ClassA assemblies. Stores complete headend information allowing reports to be printed. Shipped in CD-ROM. 	

Minimum Requirements for the Computer

Computer	INTEL Pentium III 600MHz IBM PC or similar
Telephone line	Installed (for remote operation)
Modem at the headend location	Installed (for remote operation) — RS-232C port
Modem at the computer location	Installed (for remote operation)
Computer configuration	
Hard disc	100 MB free space
CD-ROM Drive	Installed
Parallel Port	IBM PC compatible printer port
Serial Port	COM1 port, RS-232C
Mouse	Installed
RAM	256 MB
Display	SVGA monitor, 15" or 17"
Operating System	Windows 95/98/ME/NT/2000/XP
Screen Properties' Configuration	800x600 pixels or 1024x768 pixels 256 colours Small size fonts

- Local Programming with PC + PRG-300**
It is advisable to interconnect by means of BUS-013 jumpers the IKUSUP front panel sockets of the modules. The established communication bus enables to set the complete headend through a unique connection to the DB-9 socket of the last module on the right of the cascade.

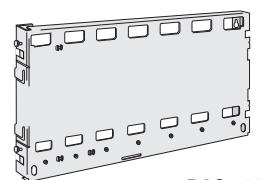

- Remote Programming with PC + PRG-300**
Communication with the PC is accomplished through modems and telephone lines. In the headend, a communication bus must be built using BUS-013 jumpers. The modem at the headend side is connected to the DB-9 socket of the last module on the right of the cascade.

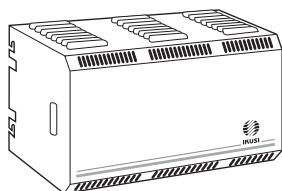

NOTE: These diagrams are not applicable for the so-called *economical models* of the ClassA modules, which do not include IKUSUP sockets.

Regulation type	switch mode		switch mode
Mains supply voltage (50/60 Hz)	VAC	100 - 240 (± 10%)	230 / 240 (± 10%)
Outputs		+12 V (5 A) (for ClassA modules) +24 V (60 mA) (for mast-head preamplifiers) +18 V (300 mA) +18 V / 22 kHz (300 mA) +13 V (300 mA) +13 V / 22 kHz (300 mA)	+12 V (5.3 A) (for ClassA modules and LNB) +24 V (60 mA) (for mast-head preamplifiers)
Max total current for +24, +18 and +13 V	mA	700	—
Efficiency	%	75	75
Mains lead		No *	Yes (bipolar plug)
Dimensions	mm	230 x 195 x 48	230 x 195 x 48

* Mains lead not included. The module has a 3-pin european standard inlet, so the mains lead to be used must have a mating CEE 22 socket (see COR-220 power cord on previous page).

- Electrical safety protection level: Class II.
- 2 "banana" jumpers, 50 cm length, are supplied to connect the appropriate outputs of the power supply to 1 or 2 ClassA receivers for line powering a terrestrial preamplifier or LNB.

CFP-500

► ClassA HEADENDS

«HMS» — Headend Control Units

CE

APPLICATION

The HMS-120 and HMS-130 units provide advanced remote control features for ClassA headends. These features include sending alarms via SMS, detecting RF levels of the headend multichannel output signal, automatically equalising these levels and the possibility of scheduling parameter settings, apparition of OSD messages and firmware updates. The HMS-130 also generates an INFO Channel which can display images and sounds previously entered as JPEG and MP3 files. The HMS units include a web server which allows the control operation to be performed from any local or remote PC using a standard browser.

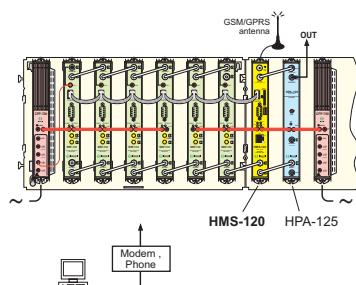

The control unit is positioned in the ClassA headend as the last module on the right of the cascade of signal modules (processors, receivers, transmodulators, regenerators). The installation of the communication local bus (IKUSUP) along the modules is required, as well as the connection of a tapped signal from the HPA amplifier to the HMS control unit.

HMS-120
4

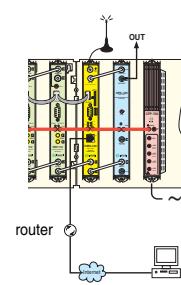

Access interfaces

The HMS control units have two interfaces for remote communication:

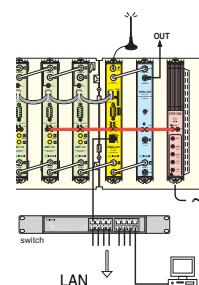

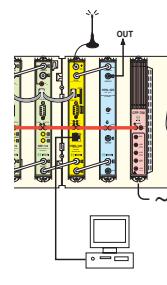

- A GSM/GPRS interface which uses an internal modem to perform control operations from any remote PC connected to the modem telephone number. A slot on the front panel allows to insert the SIM card.
- An Ethernet interface which, via an external modem/router, allows monitoring from any remote PC connected to Internet. If the headend is installed in a LAN environment, the control operations can be performed from any PC integrated therein. The interface also allows local use of a PC connected directly connected to the HMS module.

a) Remote access via GSM/GPRS

b) Remote access via Internet

c) Headend integrated into a LAN.
Control from any PC of the LAN.

d) Control in local mode
with a PC

Being developed

FEATURES

SOFTWARE

Operation software embedded
Web server
Internal GSM/GPRS modem
HTTP and support for SNMP v2
Access password
Multi-language support (english, spanish, french)

MONITORING/PROGRAMMING

Monitoring/Programming of headend through a web browser
Identification of the headend and dates of interventions
Reading of the RF level outgoing from each signal module
Reading of the RF levels of the multichannel signal outgoing from the headend
Equalization of the RF multichannel signal outgoing from the headend
Scheduling of parameter settings, OSD messages and firmware updates
Statisticians
Automatic alarm advertisements via SMS
Configuration of the HMS module through a PC
Only HMS-130 : Insertion of JPEG and MP3 files for INFO Channel

READING OF MODULES' RF OUTPUT LEVELS

Frequency range : 45-862 MHz
Range of levels : 55-90 dBµV
Accuracy of the reading : ±1.5 dBµV

GSM/GPRS MODEM

Frequency range:
GSM900 → Tx: 880-915MHz , Rx: 925-960MHz
GSM1800 → Tx: 1710-1785MHz , Rx: 1805-1880MHz
Threshold: < -102 dBm
RF output power : 2W (GSM900) , 1W (GSM1800)
Frontal slot for SIM card
Antenna — 7cm height, 50Ω impedance

READING OF LEVEL OF MULTICHANNEL SIGNAL TAPPED FROM HEADEND RF OUTPUT

Frequency range : 45-862 MHz
Range of levels : 55-90 dBµV
Accuracy of the reading : ±1.5 dBµV

MONITORING ETHERNET PORT

Standard : IEEE 802.3 10/100 BaseT
Bit rate : up to 100 Mbps
Transmission protocol : TCP/IP

LOCAL COMMUNICATION BUS

Electrical interface : RS-485 differential pair, full-duplex
Protocol : IKUSUP
Main feature : Automatic assignation of addresses to the modules of the headend

'TERMINAL' PORT

Electrical interface : V28/RS-232

INFO CHANNEL (only HMS-130)

Frequency range : 45-862 MHz
TV System : PAL B/G
Adjustable output level : 70-80 dBµV

CONNECTORS

GSM antenna : FME
RF input (headend output's tapping) : female F
Local bus : 2x 4-pin socket
Monitoring : RJ-45
Terminal : DB-9
GSM modem card : SIM socket
RF output (loop-through) : 2x F female
DC : banana sockets
Peripheral accessories : USB

► ClassA HEADENDS

«TPC» — Terrestrial/Cable TV-Channel Processing Equipment

CE

TPC HEADENDS

- Double heterodyne conversion in the 45-862 MHz frequency range. IF SAW filtering. B/G, D/K, I, L systems and DVB-T, DVB-C standards.
- Agile Processing Modules, usable either as channel converters (output channel is different to input channel) or as channel processors (output channel is the same as input channel). Adjacent channel operation at input and output.
- A TPC headend includes:
 - As many TPC Processing Modules as channels to be converted or processed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the processors.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The TPC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE TPC PROCESSORS

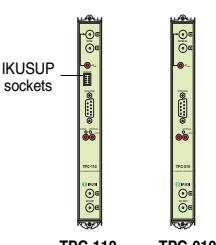

In a TPC module can be distinguished three main sections:

- "Input Channel → IF" conversion. Includes a delayed AGC circuitry that operates in the 50-90 dB μ V (analog) or 40-80 dB μ V (digital) input level ranges.
- IF filtering. A double SAW filter is used, what provides very high selectivity (>70 dB at ± 5.25 MHz from the centre for 8MHz-wide channels).
- "IF → Output Channel" conversion. The output level can be adjusted between 65 and 80 dB μ V.

Range includes two models: the **TPC-110**, which can be programmed remotely with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend, and the economical **TPC-010** model, which can be programmed just locally with the SPI-300 programming unit or a PC + PRG-300.

TPC-110

TPC-110 TPC-010

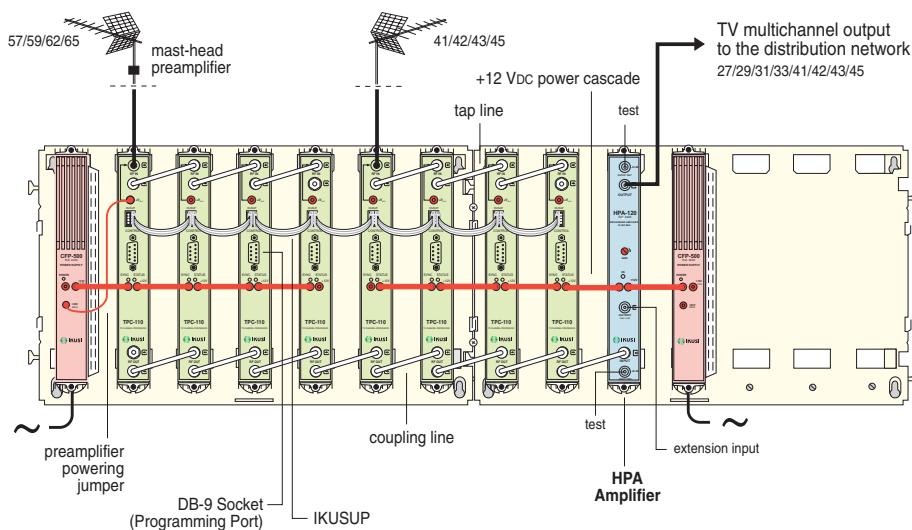

Programming of a TPC processor involves the following selections and settings:

- Input Frequency. Is the picture carrier for analog channel and the central frequency for digital channel.
- Tuning Offset (TPC-110 only). Applicable when a strong adjacent channel interferes with the channel being processed.
- AGC on/off. The automatic gain control must be switched off for system L channels.
- Manual Gain Control, only if the AGC function has been disabled.
- IF Bandwidth. Two options: 7 or 8 MHz.
- Output Frequency. Same indications stated above for input frequency.
- RF output level. 15 dB adjustable.

The output signal has very low phase noise and very clean wideband spectrum. On the other hand, a very low broadband noise floor (< -75 dBc) permits the use of multiple processors in a headend with very little deterioration of the CNR.

Simple cabling of TPC headends

The TPC modules feature two directionally coupled input and output ports. Antenna or cable network signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for an optional mast-head preamplifier.

- Exemple of «TPC» headend for conversion of four channels and processing of other four ones. Contains 8 Processors TPC-110, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined Base-plates.

► ClassA HEADENDS

«TRF» — Free-To-Air Digital Terrestrial TV Reception Equipment

DVB
Digital Video
Broadcasting

CE

TRF HEADENDS

- Terrestrial TV reception, standard DVB-T / MPEG-2 (EN 300 744).
- Digital-to-Analogue Transmodulation Process (COFDM → AM) that presents the clear TV programmes transmitted in COFDM Terrestrial-TV channels on conventional VHF/UHF channels (VSB vestigial side band or DSB double side band; any TV system and Colour system).
- A TRF headend includes:
 - As many TRF Receiving Modules as free-to-air TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The TRF headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a TRF installed in the headend, the end user does not require a Set Top Box or any additional devices to view the clear digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE TRF RECEIVERS

A TRF receiving module carries out the complete channel processing from the input to the output:

- tunes a COFDM digital channel within the BIII or UHF bands,
- selects a TV programme from the multiplex being received, and
- directs it to a conventional TV channel which is selectable throughout the 47-862 MHz band.

Range includes different models for VSB or DSB output channel spectrums; for B/G, D/K, I, or L TV systems; and for mono sound, or A2 or Nicam stereo/dual sounds.

Programming of each module involves the following selections and settings:

- Central Input Frequency (125 kHz increments).
- Bandwidth (7 or 8 MHz).
- Hierarchy Level (high or low priority).
- TV Programme and Audio Service.
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

Models featuring VSB output are utilizable for adjacent channel operation. If this operation is not required, existing models featuring DSB output may be used without problems. The first ones present, on the other hand, a very low broadband noise floor (< -75 dBc) that permit to use multiple modules in the headend with very little deterioration of the CNR.

Simple cabling of TRF headends

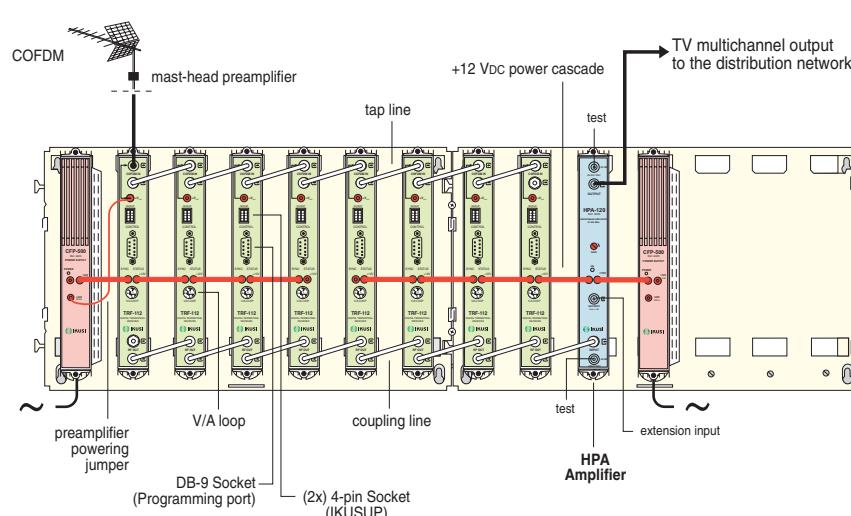

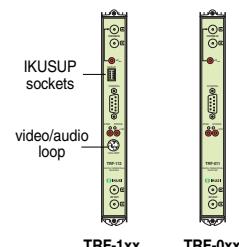

The TRF receiving modules feature two directionally coupled input and output ports. Antenna signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for an optional mast-head preamplifier.

An external video/audio loop, which is switched under control software, is available on models TRF-1xx. The loop is not available in the so called **economical models** (TRF-0xx).

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend. The TRF-0xx economical models do not have IKUSUP sockets and cannot therefore be programmed remotely.

TRF-111

— Example of «TRF» headend for eight clear digital terrestrial TV programmes. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined Base-plates.

► ClassA HEADENDS

«TDC» — Digital Terrestrial TV Reception Equipment with Embedded CA

DVB
Digital Video
Broadcasting **CE**

TDC HEADENDS

- Terrestrial TV reception, standard DVB-T / MPEG-2 (EN 300 744).
- De-encryption and Digital-to-Analogue Transmodulation Process (Encrypted COFDM → Clear AM). The encrypted TV programmes transmitted in COFDM Terrestrial-TV channels are de-encrypted and presented on conventional vestigial side band VHF/UHF channels (any TV system and Colour system).
- A TDC headend includes:
 - As many appropriate Embedded CA (Conditional Access) Receiving Modules as de-encrypted TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The TDC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a TDC installed in the headend, the end user does not require a Set Top Box or any additional devices to view the de-encrypted digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE TDC RECEIVERS

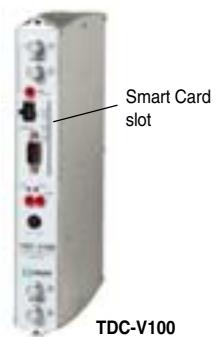

A TDC embedded CA receiving module carries out a complete channel processing from the input to the output:

- tunes a COFDM digital channel within the BIII or UHF bands,
- selects an encrypted TV programme from the multiplex being received, and
- de-encrypts and presents it on a conventional TV channel which is selectable throughout the 45-862 MHz band.

Range includes different models in terms of the embedded conditional access, as well as the TV System and the Audio System for the single-channel output signal. A front slot allows to insert the operator's smart card.

Programming of each module involves the following selections and settings:

- Central Input Frequency (125 kHz increments).
- Bandwidth (7 or 8 MHz).
- Hierarchy Level (high or low priority).
- TV Programme and Audio Service.
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

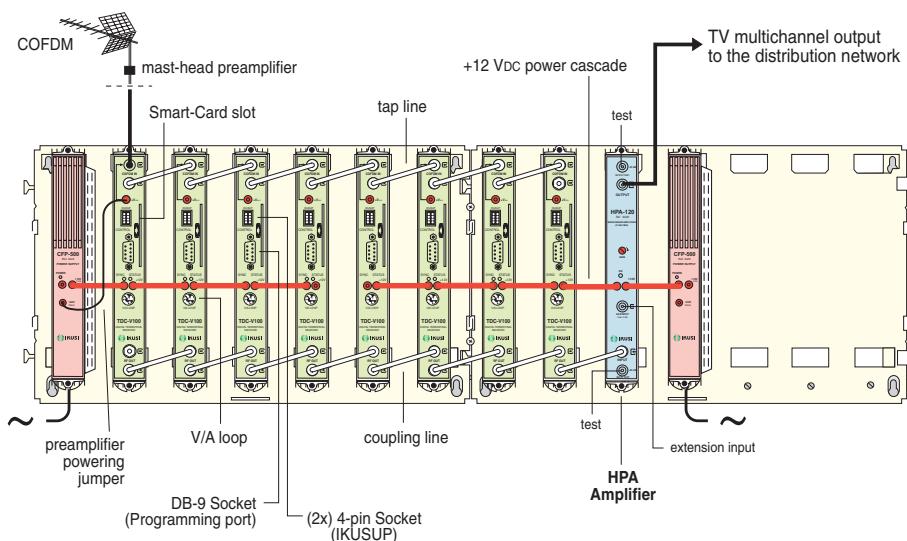

TDC-V100

Simple cabling of TDC headends

The TDC receiving modules feature two directionally coupled input and output ports. Antenna signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier —the HPA module or an external wideband amplifier— which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for an optional mast-head preamplifier.

The TDC receivers have video/audio loop-through capacity. The external loop is switched under control software.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend.

- Example of «TDC» headend for eight encrypted digital TV programmes. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined Base-plates.

► ClassA HEADENDS

«TDI» — Digital Terrestrial COFDM-QAM Transmodulation Equipment

DVB
Digital Video
Broadcasting **CE**

TDI HEADENDS

- Digital Transmodulation (COFDM → QAM) with Transport Stream Processing. The COFDM channels located in the 174-230 MHz or 470-862 MHz bands are transformed to QAM channels (16 to 256 symbols) located in the 47-862 MHz band. NIT table can be adapted to the new network created.
- A TDI headend includes:
 - As many TDI Transmodulators as QAM channels to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output QAM channels from the transmodulators.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The TDI headends provide a QAM multichannel signal whose level is appropriate to feed the distribution network. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend. The user requires a Digital Set Top to convert the QAM signals into the appropriate signals that can be accepted by a conventional TV set, and to control access to encrypted TV programs.

FUNCTIONAL DESCRIPTION OF THE TDI TRANSMODULATORS

A TDI transmodulator carries out the complete channel processing from the input to the output:

- tunes a COFDM digital channel,
- demodulates the signal being received,
- processes the transport stream, and
- re-modulates it in QAM format (16, 32, 64, 128 or 256 symbols) on an RF channel that is selectable within the 45-862 MHz frequency range.

Programming of the module involves the following selections and settings:

- Central Input Frequency (125 kHz increments)
- Bandwidth (7 or 8 MHz)
- Hierarchy Level (high or low priority)
- Central Output Frequency (250 kHz increments)
- Output Modulation Scheme (16, 32, 64, 128 or 256QAM)
- Roll-Off factor ("half Nyquist filter")
- RF Output Level
- Output Symbol Rate
- Service and Conditionnal Access Blockade

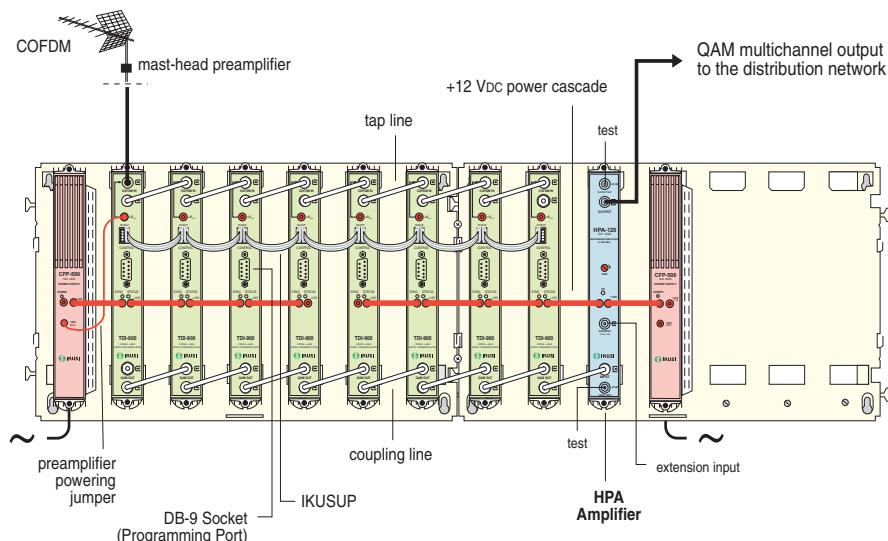

TDI-900

Simple cabling of TDI headends

The TDI transmodulators feature two directionally coupled input and output ports. Antenna signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for an optional mast-head preamplifier.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

The IKUSUP bus must be installed in order to perform NIT adaptation. The last module at the right end of the IKUSUP cascade carries out the control function.

- Example of «TDI» headend for eight digital terrestrial channels. Contains 8 Transmodulators, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined baseplates.

► ClassA HEADENDS

«SRF» — Free-To-Air Digital Satellite TV Reception Equipment

DVB Digital Video Broadcasting CE

SRF HEADENDS

- Satellite TV reception, standard DVB-S / MPEG-2 (EN 300 421).
- Digital-to-Analogue Transmodulation Process (QPSK → AM) that presents the clear TV programmes transmitted in QPSK Sat-TV channels on conventional VHF/UHF channels (VSB vestigial side band or DSB double side band; any TV system and Colour system).
- An SRF headend includes:
 - As many SRF Receiving Modules as free-to-air TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The SRF headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a SRF installed in the headend, the end user does not require a Set Top Box or any additional devices to view the clear digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE SRF RECEIVERS

An SRF receiving module carries out the complete channel processing from the input to the output:

- tunes a QPSK Sat-IF digital channel in the 950-2150 MHz band,
- selects a TV programme from the multiplex received, and
- directs it to a conventional TV channel which is selectable throughout the 45-862 MHz band.

Range includes different models for VSB or DSB output channel spectrums; for B/G, D/K, I, L or M/N TV systems; and for mono or A2 stereo/dual sounds.

Programming of each module involves the following selections and settings:

- Central Input Frequency (1 MHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- TV Programme and Audio Service. (Or a Radio Programme. Image will be black).
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

SRF-111

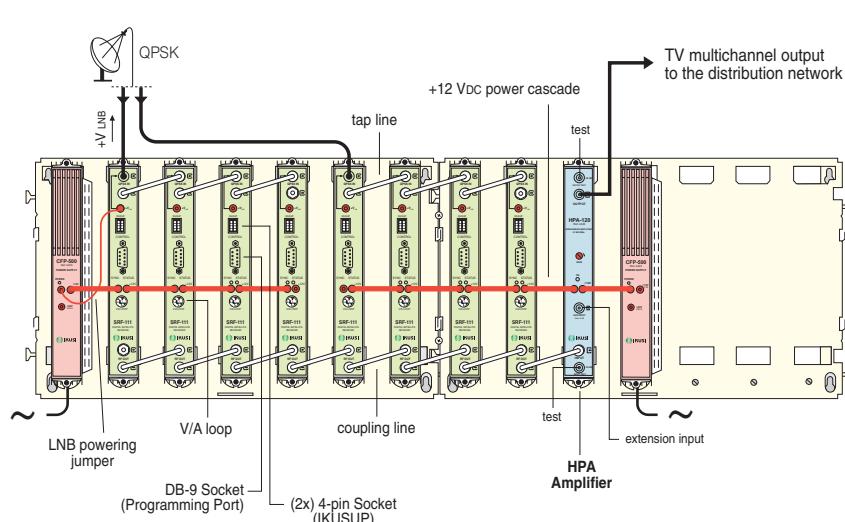

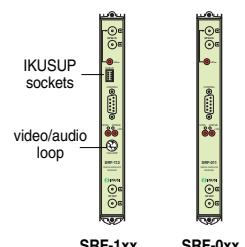

Models featuring VSB output are utilizable for adjacent channel operation. If this operation is not required, existing model featuring DSB output may be used without problems. The first ones present, on the other hand, a very low broadband noise floor (< -75 dBc) that permit to use multiple modules in the headend with very little deterioration of the CNR.

Simple cabling of SRF headends

The SRF receiving modules feature two directionally coupled input and output ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier —the HPA module or an external wideband amplifier— which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for the attached LNB.

An external video/audio loop, which is switched under control software, is available on models SRF-1xx. The loop is not available in the so called **economical models** (SRF-0xx).

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend. The SRF-0xx economical models do not have IKUSUP sockets and cannot therefore be programmed remotely.

- Example of «SRF» headend for eight clear digital satellite TV programmes; four programmes arrive via a down lead cable and other four ones via another. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined baseplates.

SDC HEADENDS

- Satellite TV reception, standard DVB-S / MPEG-2 (EN 300 421).
- De-encryption and Digital-to-Analogue Transmodulation Process (Encrypted QPSK → Clear AM). The encrypted TV programmes transmitted in QPSK Sat-TV channels are de-encrypted and presented on conventional vestigial side band VHF/UHF channels (any TV system and Colour system).
- An SDC headend includes:
 - As many appropriate Embedded CA (Conditional Access) Receiving Modules as de-encrypted TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The SDC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a SDC installed in the headend, the end user does not require a Set Top Box or any additional devices to view the de-encrypted digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE SDC RECEIVERS

An SDC embedded CA receiving module carries out a complete channel processing from the input to the output:

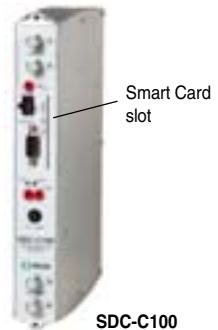

- tunes a QPSK Sat-IF digital channel in the 950-2150 MHz band,
- selects an encrypted TV programme from the multiplex being received, and
- de-encrypts and presents it on a conventional TV channel which is selectable throughout the 45-862 MHz band.

Range includes different models in terms of the embedded conditional access, as well as the TV System and the

Audio System for the single-channel output signal. A front slot allows to insert the operator's smart card.

Programming of each module involves the following selections and settings:

- Central Input Frequency (1 MHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- TV Programme and Audio Service. (Or a Radio Programme. Image will be black).
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

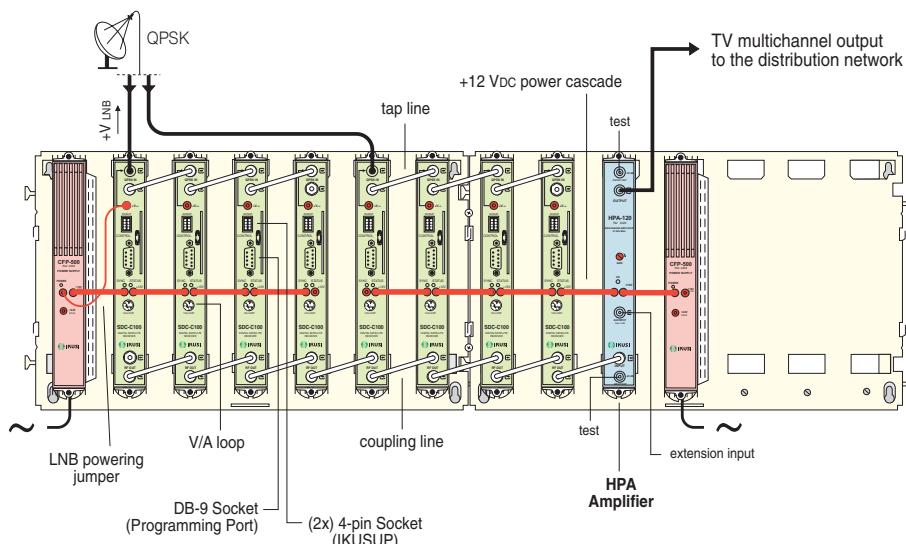

Simple cabling of SDC headends

The SDC receiving modules feature two directionally coupled input and output ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier —the HPA module or an external wideband amplifier— which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for the attached LNB.

The SDC receivers have video/audio loop-through capacity. The external loop is switched under control software.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend.

- Example of «SDC» headend for eight encrypted digital TV programmes; four programmes arrive via a down lead cable and other four ones via another. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined Base-plates.

(1) When selecting a stereo audio service, the output channel sound carrier is modulated with the "L+R" sum. If the audio service selected is dual, the carrier can be modulated with any of the "audio1", "audio2" or "audio1+audio2" signals.

- Each module is packed with:

- 2 F plug bridges, 64 mm length, for input tap line and output coupling line.
- 1 DC plug bridge, 53 mm length, for connection of +12 VDC voltage.

► ClassA HEADENDS

«SRC» — Digital Sat TV MultiCrypt Reception Equipment

DVB
Digital Video
Broadcasting **CE**

SRC HEADENDS

- Reception of encrypted Sat-TV programs. Standard DVB-S / MPEG-2 (EN 300 421).
- Receiving Modules with Common Interface. The encrypted TV programmes transmitted on QPSK channels are de-encrypted and presented on conventional VHF/UHF channels (VSB vestigial side band or DSB double side band; any TV system or Colour system).
- An SRC headend includes:
 - As many SRC Receiving Modules as de-encrypted TV programmes to be distributed. At each module, one CAM (Conditional Access Module) containing the Operator's Smart Card must fit the front panel slot.
 - One HPA Amplifier that amplifies the sum of the receivers' output TV channels.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The SRC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With an SRC installed in the headend, the end user does not require a Set Top Box or any additional devices to view the de-encrypted digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF SRC RECEIVERS

An SRC receiving module with CAM + Operator's Smart Card inserted, carries out a complete channel processing from the input to the output:

- tunes a QPSK Sat-IF digital channel in the 950-2150 MHz band,
- selects an encrypted TV programme from the multiplex being received, and
- de-encrypts and presents it on a conventional TV channel that is selectable throughout the 45-862 MHz band.

Range includes different mono sound models for VSB or DSB output channel spectrums and for available or non-available remote programming function.

Programming of each module involves the following selections and settings:

- Central Input Frequency (1 MHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- TV Programme and Audio Service. (Or a Radio Programme. Image will be black).
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

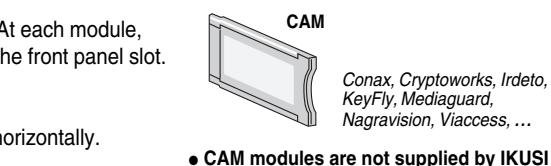

Models featuring VSB output are utilizable for adjacent channel operation. If this operation is not required, existing model featuring DSB output may be used without problems. The first ones present, on the other hand, a very low broadband noise floor (< -75 dBc) that permits the use of multiple modules in a headend with very little deterioration of the CNR.

Simple cabling of SRC headends

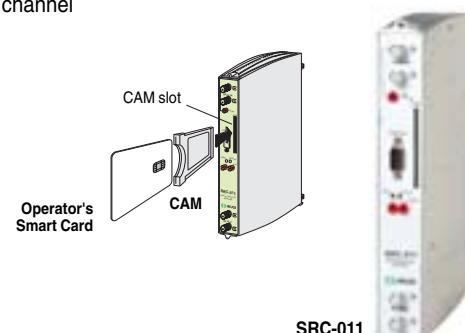

The SRC receiving modules feature two directionally coupled input and output ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier —the HPA module or an external wideband amplifier— which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for the attached LNB.

An external video/audio loop, which is switched under control software, is available on model SRC-111. The loop is not available in the so called **economical models** (SRC-011 and SRC-051).

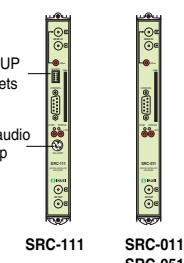

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC using either the PRG-300 software or a standard web browser if the HMS control unit is installed in the headend. The SRC-0xx economical models do not have IKUSUP sockets and cannot therefore be programmed remotely.

• CAM modules are not supplied by IKUSI

► ClassA HEADENDS

«MDI» — Digital Satellite xPSK-QAM Transmodulation Equipment

DVB
Digital Video
Broadcasting **CE**

MDI HEADENDS

- Digital Transmodulation (xPSK→QAM). The QPSK or 8PSK channels located in the Sat-IF frequency band (950-2150 MHz) are transformed to QAM channels (16 to 256 symbols) located in the 45-862 MHz band.

The equipment includes three models of transmodulators: MDI-900 and MDI-810 for DVB-S standard and MDI-910 for DVB-S2. The MDI-900 and MDI-910 can perform Transport Stream Processing.

- An MDI headend includes:

- As many MDI Transmodulators as QAM channels to be distributed.
- One HPA Amplifier that amplifies the sum of the combined output QAM channels from the transmodulators.
- One or more CFP Power Supplies.
- Wall-fixing Base-Plate or Rack-frame. Additional base-plates can be joined horizontally.
- Usually, one Housing unit.
- If the headend is voluminous, one or more AMX-400 combiners.

The MDI headends provide a QAM multichannel signal whose level is appropriate to feed the distribution network. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend. The user requires a Digital Set Top Box to convert the QAM signals into the appropriate signals that can be accepted by a conventional TV set, and to control access to encrypted TV programs.

FUNCTIONAL DESCRIPTION OF THE MDI TRANSMODULATORS

An MDI transmodulator carries out the complete channel processing from the input to the output:

- tunes a Sat-IF digital channel,
- demodulates the signal being received,
- processes the transport stream (only for MDI-900 and MDI-910), and
- re-modulates it in QAM format (16, 32, 64, 128 or 256 symbols) on an RF channel that is selectable within the 45-862 MHz frequency range.

Module programming involves the following selections and settings:

- Central Input Frequency (1 MHz increments)
- Input Symbol Rate (0.001 MS/s increments)
- Central Output Frequency (250 kHz increments)
- Output Modulation Scheme (16, 32, 64, 128 or 256QAM)
- Roll-Off factor ("half Nyquist filter")
- RF output level
- Only for MDI-900 and MDI-910: Output Symbol Rate and Service and CA Blockade

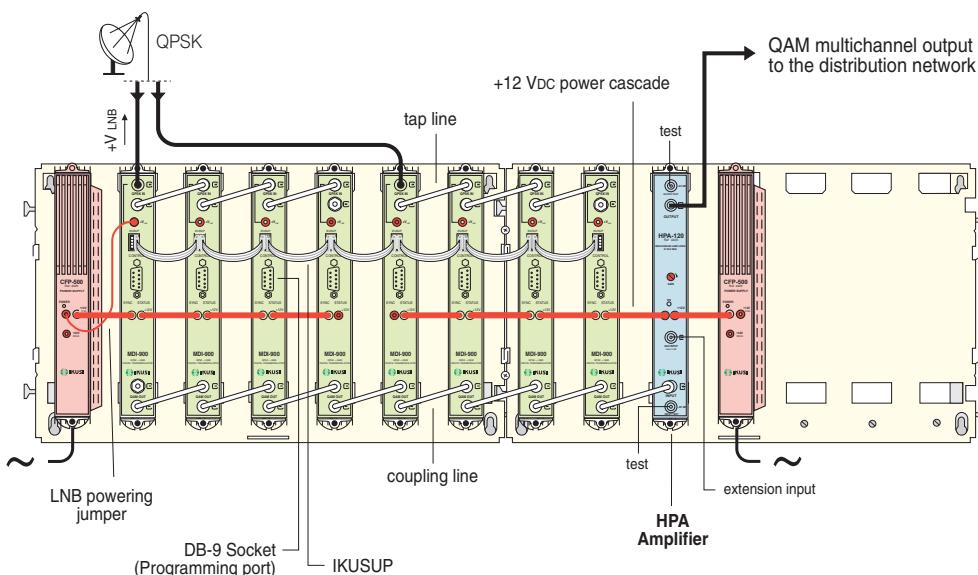

MDI-900

Simple cabling of MDI headends

The MDI transmodulators feature two directionally coupled input and output ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wide-band amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade. A third banana socket is available to connect the power for the attached LNB.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

In order to perform NIT adaptation (possible only in headends with MDI-900 or MDI-910 models), the IKUSUP bus must be installed. The last module at the right end of the IKUSUP cascade carries out the control function.

— Example of «MDI» headend for eight transponders. Contains 8 MDI-900 Transmodulators, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined baseplates.

«CRF» — Free-To-Air Digital Cable TV Reception Equipment

DVB
Digital Video
Broadcasting **CE**

CRF HEADENDS

- Cable TV reception, standard DVB-C / MPEG-2 (EN 300 429).
- Digital-to-Analogue Transmodulation Process (QAM → AM) that presents the clear TV programmes transmitted in QAM Cable-TV channels on conventional vestigial side band VHF/UHF channels (any TV system and Colour system).
- A CRF headend includes:
 - As many CRF Receiving Modules as free-to-air TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The CRF headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a CRF installed in the headend, the end user does not require a Set Top Box or any additional devices to view the clear digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE CRF RECEIVERS

A CRF receiving module carries out the complete channel processing from the input to the output:

- tunes a QAM modulated RF carrier in the 51-858 MHz band,
- selects a TV programme from the multiplex being received, and
- directs it on a conventional TV channel which is selectable throughout the 45-862 MHz band.

Range includes two mono sound models for B/G and D/K/I/L systems.

Programming of each module involves the following selections and settings:

- Central Input Frequency (250 kHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- Input Modulation Scheme (16, 32, 64, 128 or 256QAM)
- TV Programme and Audio Service.
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

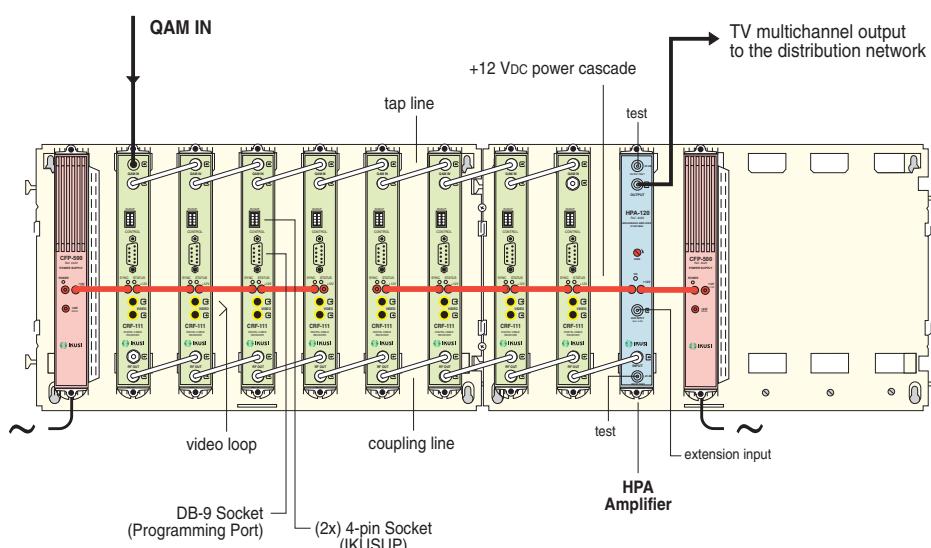

CRF-111

Simple cabling of CRF headends

The CRF receiving modules feature two directionally coupled input and output ports. Incoming QAM signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade.

The CRF receivers have video loop-through capacity. The external loop is switched under control software.

Local programming is carried out with the SPI-300 unit, which is connected to each module individually. Remote programming may be carried out only if the HMS control unit is installed in the headend, through modems and a PC using a standard web browser.

- Example of «CRF» headend for eight clear digital cable TV programmes. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined baseplates.

«CDC» — Digital Cable-TV Reception Equipment with Embedded CA

DVB
Digital Video
Broadcasting **CE**

CDC HEADENDS

- Cable TV reception, standard DVB-C / MPEG-2 (EN 300 429).
- De-encryption and Digital-to-Analogue Transmodulation Process (Encrypted QAM → Clear AM). The encrypted TV programmes transmitted in QAM Cable-TV channels are de-encrypted and presented on conventional vestigial side band VHF/UHF channels.
- A CDC headend includes:
 - As many appropriate Embedded CA (Conditional Access) Receiving Modules as de-encrypted TV programmes to be distributed.
 - One HPA Amplifier that amplifies the sum of the combined output TV channels from the receivers.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The CDC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With a CDC installed in the headend, the end user does not require a Set Top Box or any additional devices to view the de-encrypted digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE CDC RECEIVERS

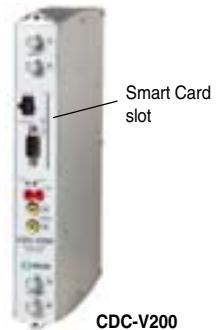

A CDC embedded CA receiving module carries out a complete channel processing from the input to the output:

- tunes a QAM-modulated RF carrier in the 51-858 MHz band,
- selects an encrypted TV programme from the multiplex being received, and
- de-encrypts and presents it on a conventional TV channel which is selectable throughout the 45-862 MHz band.

Range includes a unique model —CDC-V200— with Viaccess conditional access embedded. A front slot allows to insert the operator's smart card.

Programming of the module involves the following selections and settings:

- Central Input Frequency (250 kHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- Input Modulation Scheme (16, 32, 64, 128 or 256QAM).
- TV Programme and Audio Service.
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

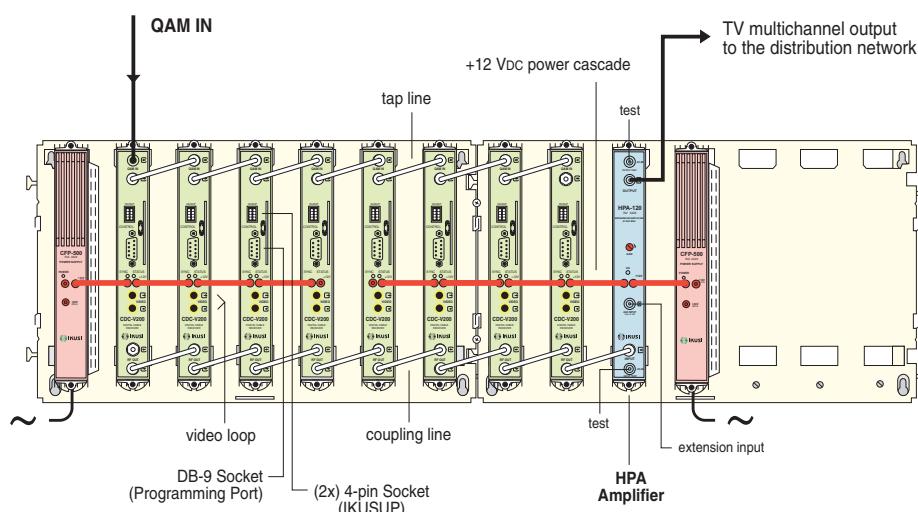

CDC-V200

Simple cabling of CDC headends

The CDC receiving modules feature two directionally coupled input and output ports. Incoming QAM signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade.

The CDC receivers have video loop-through capacity. The external loop is switched under control software.

Local programming is carried out with the SPI-300 unit, which is connected to each module individually. Remote programming may be carried out only if the HMS control unit is installed in the headend, through modems and a PC using a standard web browser.

- Example of «CDC» headend for eight Viaccess-encrypted digital cable TV programmes. Contains 8 Receivers, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined Base-plates.

«CRC» — Digital Cable-TV MultiCrypt Reception Equipment

DVB
Digital Video
Broadcasting

CE

CRC HEADENDS

- Reception of encrypted Cable TV programs. Standard DVB-C / MPEG-2 (EN 300 429).
- Receiving Modules with Common Interface. The encrypted TV programmes transmitted on QAM Cable-TV channels are de-encrypted and presented on conventional VHF/UHF channels (VSB vestigial side band; any TV system or Colour system).
- A CRC headend includes:
 - As many CRC Receiving Modules as de-encrypted TV programmes to be distributed. At each module, one CAM (Conditional Access Module) containing the Operator's Smart Card must fit the front panel slot.
 - One HPA Amplifier that amplifies the sum of the receivers' output TV channels.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The CRC headends provide a TV multichannel signal whose level is appropriate to feed the distribution network. With an CRC installed in the headend, the end user does not require a Set Top Box or any additional devices to view the de-encrypted digital TV programs being distributed. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE CRC RECEIVERS

A CRC receiving module with CAM + Operator's Smart Card inserted, carries out a complete channel processing from the input to the output:

- tunes a QAM-modulated RF carrier in the 51-858 MHz band,
- selects an encrypted TV programme from the multiplex being received, and
- de-encrypts and presents it on a conventional TV channel that is selectable throughout the 45-862 MHz band.

Range includes two mono-sound models, both featuring VSB output spectrum.

Programming of the module involves the following selections and settings:

- Central Input Frequency (250 kHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- Input Modulation Scheme (16, 32, 64, 128 or 256QAM).
- TV Programme and Audio Service.
- Parameters of the output TV channel (video carrier frequency, TV system, colour system, video modulation depth, audio modulation index, carrier level ratio, output level).
- Image Format. Possible conversions are 16:9 to 4:3 Pan&Scan and 16:9 to 4:3 Letter-Box.

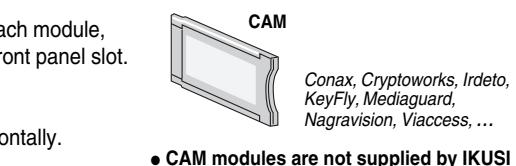

The two available CRC receivers are utilizable for adjacent channel operation. Both present, on the other hand, a very low broadband noise floor (< -75 dBc) that permits the use of multiple modules in a headend with very little deterioration of the CNR.

Simple cabling of CRC headends

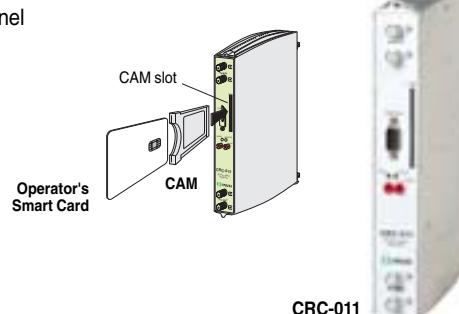

The CRC receiving modules feature two directionally coupled input and output ports. Incoming QAM signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier —the HPA module or an external wideband amplifier— which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade.

An external video/audio loop, which is switched under control software, is available on model CRC-121. The loop is not available in the so called **economical model** (CRC-011).

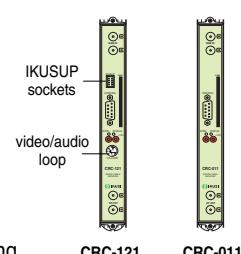

Local programming is carried out with the SPI-300 unit, which is connected to each module individually. Remote programming may be carried out only if the HMS control unit is installed in the headend, through modems and a PC using a standard web browser. The CRC-011 economical model does not have IKUSUP sockets and cannot therefore be programmed remotely.

• CAM modules are not supplied by IKUSI

► ClassA HEADENDS

«CGT» — Cable TV QAM-QAM Regeneration Equipment

CGT HEADENDS

- TV Standard : DVB-C / MPEG-2 (EN 300 429).
- Transparent Digital Transmodulation Process (QAM → QAM) that regenerates the QAM modulated carriers by correcting the errors arisen in the data stream in the transmission along the cable network. Carrier frequencies (from 51 to 858 MHz) and modulation scheme (16 to 256QAM) of the errorless, regenerated QAM signals can be set equal or different to those of the QAM incoming signals.
- A CGT headend includes:
 - As many CGT Regenerators as QAM channels to be *regenerated*.
 - One HPA Amplifier that amplifies the sum of the combined output QAM channels from the regenerators.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

The CGT headends provide a QAM multichannel signal whose level is appropriate to feed the distribution network. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by another existing headend.

FUNCTIONAL DESCRIPTION OF THE CGT REGENERATORS

A CGT regenerator carries out the complete channel processing from the input to the output:

- tunes a QAM modulated RF carrier in the 51-858 MHz band,
- demodulates this carrier,
- corrects errors of data stream, and
- re-modulates the errorless data signal on a QAM channel that is selectable within the 51-858 MHz frequency range.

Programming of the module involves the following selections and settings:

- Central Input Frequency (250 kHz increments)
- Input Symbol Rate (0.001 MS/s increments)
- Input Modulation Scheme (16, 32, 64, 128 or 256QAM)
- Central Output Frequency (250 kHz increments)
- Output Modulation Scheme (16, 32, 64, 128 or 256QAM)
- Roll-Off factor ("half Nyquist filter")
- RF output level

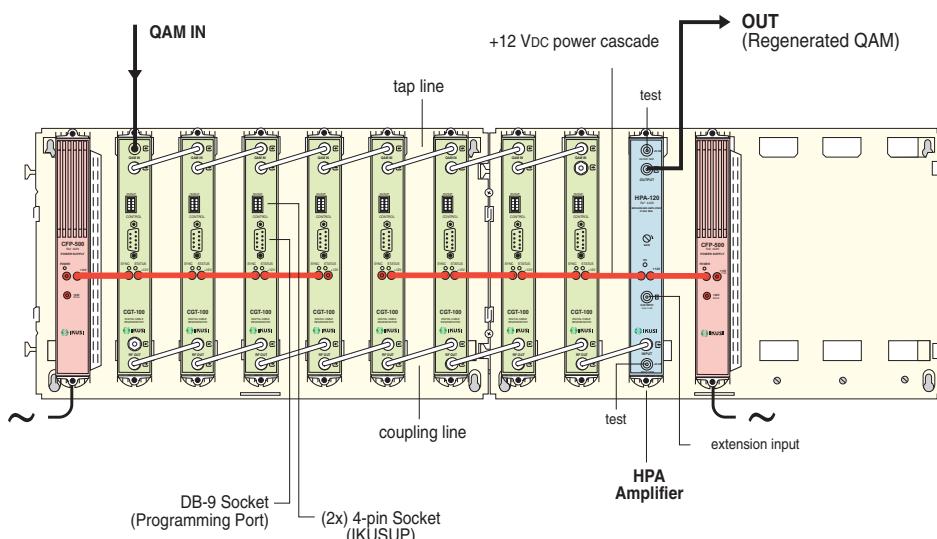

CGT-100

Simple cabling of CGT headends

The CGT regenerators feature two directionally coupled input and output ports. Incoming QAM signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. On the output side, the same procedure is repeated which forms the channel coupling. The sum of the combined channels is then connected in the same way to the drive amplifier—the HPA module or an external wideband amplifier—which then feeds the distribution network. For power connection, each module has two DC banana sockets that allow to build a +12 VDC cascade.

Local programming is carried out with the SPI-300 unit, which is connected to each module individually.

— Example of «CGT» headend for eight QAM modulated channels. Contains 8 Regenerators, 1 Amplifier and 2 Power Supplies, all fixed on 2 horizontally joined baseplates.

«MCP» — Vestigial Side Band TV Modulators

CE

MCP MODULATORS

- Vestigial Side Band TV Modulators. Mono and A2 or Nicam Stereo/Dual Sounds. TV Systems: B/G, D/K, I, L, M/N.
- IF modulation and SAW filtering for maximum harmonic reduction and true VSB response. Adjacent channel operation.
- Frequency agility. Any selectable TV channel within the 45-862 MHz band. PLL frequency synthesized.
- Built-in test pattern generator.
- An MCP headend includes:
 - MCP Modulators, one per TV channel.
 - One HPA amplifier that amplifies the sum of the combined output TV channels from the modulators.
 - One or more CFP Power Supplies.
 - One or more Rack-Frames or wall-fixing Base-Plates. The base-plates can be joined horizontally.
 - Usually, housing units for the base-plates.
 - If the headend is voluminous, one or more AMX-400 combiners.

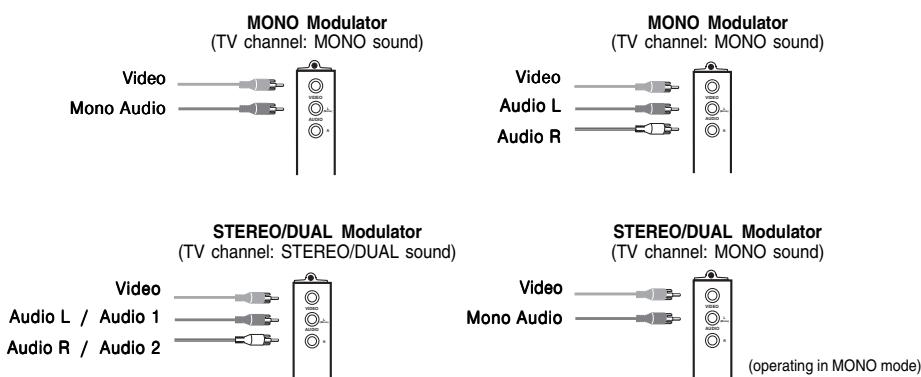

The MCP assembly provides a TV multichannel signal whose level is appropriate to feed the distribution network. An extension input at the HPA amplifier allows easy coupling of the wideband 47-862 MHz signal provided by an existing reception headend.

MCP-421

Audio functionality

The MCP modulators family includes different models for mono and stereo/dual operation. Audio connection functionality on each model is not limited to the basic one —use of 1 signal source for mono models and 2 signal sources for stereo/dual models—, but it allows the reciprocal one, that is to say, use of 2 sources, L and R, for mono models and 1 source for stereo/dual models. Therefore, it is possible to use a mono model with a stereo/dual source (L and R signals are summed by the modulator itself) and a stereo/dual model with a mono source—the output TV channel will be, obviously, a mono sound channel. The following diagrams show the mentioned possibilities of use :

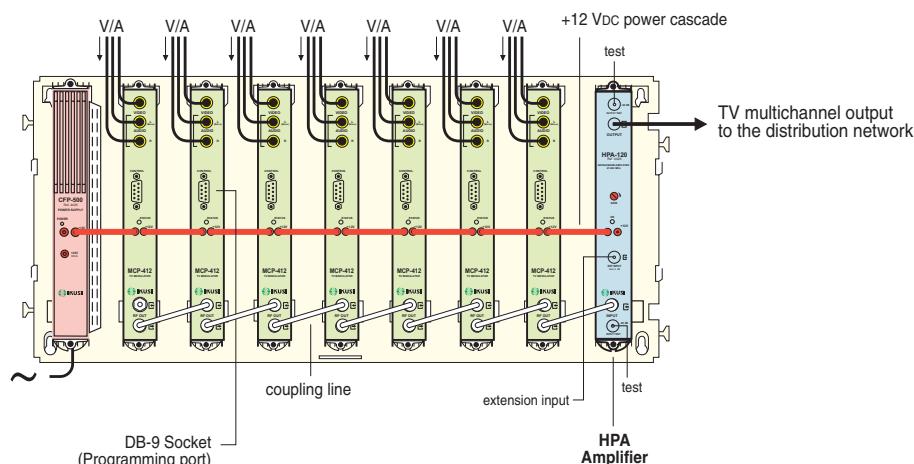

Simple cabling of MCP headends

Video and audio input ports of the modulators are disposed at the top of the front panels. The RF output of each module is presented at the bottom on two directionally coupled F ports, so a channel coupling line may be formed along the MCP assembly by using the supplied plug bridges. The sum of the combined channels is connected to the drive amplifier—the HPA module or an external wideband amplifier. For power connection, each module has two DC banana sockets to perform a +12 VDC cascade.

Programming connection using the SPI-300 or PC is individual —module by module. The process involves the following selections and settings:

- Video Carrier Frequency
- TV System
- Video Modulation Depth
- Audio Modulation Deviation
- Carrier Level Ratio
- Audio Mode (mono-stereo-dual)
- RF Output Level
- Generation of Video Test Signal

— Example of «MCP» headend with 7 Modulators, 1 Amplifier and 1 Power Supply, all fixed on 1 baseplate.

Block diagram

Application example

- Application of 1 HPA-920 within a ClassA headend which process 6 terrestrial TV channels and amplifies one satellite polarity. The other modules are 6 TPC-010 processors, 1 HPA-125 amplifier and 2 power supplies (CFP-500 and CFP-700). All the modules are fixed on 2 horizontally joined BAS-700 Base-plates.

A TV multichannel signal supplied for an SSB headend is fed to the ClassA headend through the extension input port of the HPA-125 amplifier.

► ClassA HEADENDS

AMX-400 — 4-way 47-862 MHz Active Combiner

CE

- Application in voluminous ClassA headends where the modules (processors, receivers, transmodulators, modulators, regenerators) are mounted in several deck-arranged rack-frames or baseplates. The AMX-400 is a 4-input combiner that has been designed to combine up to 24 channels (6 channels per input). The system is enlargeable, so that it is possible to combine up to 96 channels by using 4 AMX-400 and one final passive combiner (or another AMX at IMD decrease's expense) . The sum of the combined signals is connected to the launch amplifier used (HPA-120 or HPA-125).
- Total isolation between inputs.
- Net combining gain. Push-pull amplification technology.
- Adjustable output level.
- 75Ω output test port.

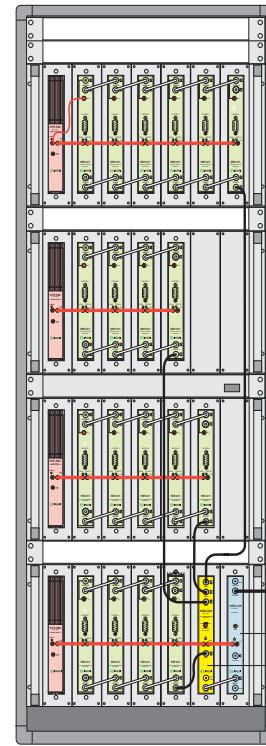

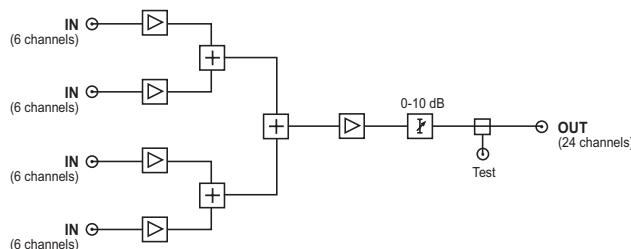

AMX-400

1 AMX-400 for 19 (6+4+5+4) channels

► ClassB HEADENDS

ClassB Modules — Range and General Features

ClassB range includes programmable, space-efficient satellite and terrestrial DVB demodulators and VSB TV modulators. All modules have identical format and are simply to place into a 3RU subrack. Connection ports for video, audio, RF and power are located on the rear panel.

The range includes the following types of modules:

- «TDF» : Free-To-Air DVB-T Demodulators (pages 80/81).
- «SDF» : Free-To-Air DVB-S Demodulators (pages 82/83).
- «SDE» : DVB-S Demodulators with Embedded Conditional Access (pages 84/85).
- «CMK»: Vestigial Side Band TV Modulators (pages 86-88).
- «CFK» : Power Supply (page 79).

The family is complemented with accessories for programming and installation (next pages 78 and 79).

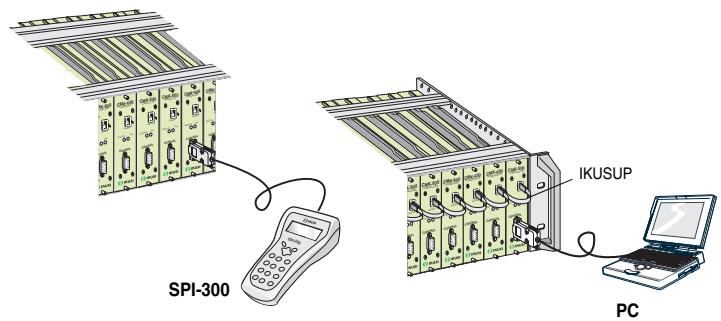

SDF-102
demodulator

PROGRAMMING AND FIRMWARE UPDATE

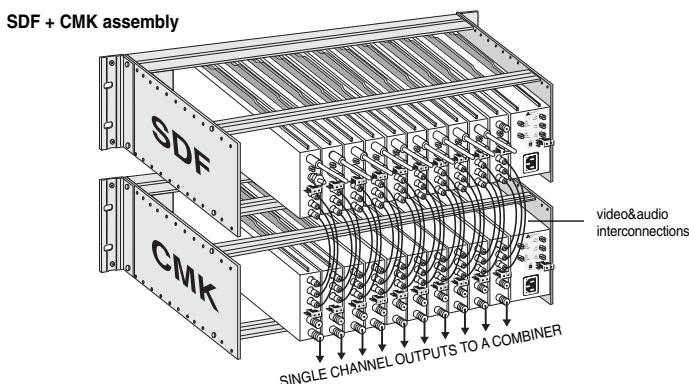

ClassB modules are locally programmed and adjusted either with the SPI-300 programming unit from IKUSI or with a PC with the PRG-300 software installed. In this second case, a communication bus (IKUSUP) must be installed along the modules using interconnection jumpers. Programming with PC can also be done remotely through modems by using the PRG-300 software. The parameter values are controlled in each module by a built-in, powerful microprocessor and remain unalterable unless they are modified with the SPI or PC.

Firmwares of the modules and programming unit can be updated. The corresponding files are downloaded from <http://www.ikusi.com>.

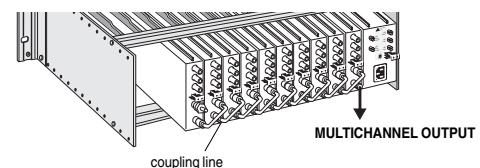

SEPARATE SINGLE-CHANNEL OUTPUTS OR ONE MULTICHANNEL OUTPUT IN CMK HEADENDS

CMK modulators can feature single RF output port or, on request, two "looped" RF ports. In the first case, the CMK headend provides separate single channel signals to be connected to an RF combiner. In the second case, a coupling line may be installed along the headend, using the plug bridges supplied, in such a way that no combiner is required.

Modulators with loop-through facility :

BISS OPERATION

The **ClassB** demodulators can operate in BISS systems (BISS: Basic Interoperable Scrambling Systems).

Model	SPI-300
Reference	4070
<ul style="list-style-type: none"> For programming the ClassB modules. Cable connection to the DB-9 front panel socket. 20x4 character alphanumerical display. Numerical and function keys. Microprocessor controlled. User friendly software (selectable language: english, spanish, french). Built-in diagnostic and error identification. Module firmware update (except CMK modulators). Firmware of the SPI-300 can also be updated through a PC. Capacity of 500 preset memory allocations for repetitive ClassB module configurations. No battery required. Powered through the interface lead (max consumption: 150 mA). DC jack to connect a +15 VDC voltage from an auxiliary power supply when updating the internal firmware through a PC. Dimensions: 160x75x40 mm. 	

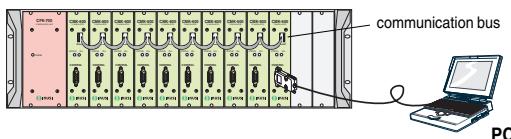

PRG-300

PC Software for Local and Remote Programming

Model	PRG-300
Reference	9602
<ul style="list-style-type: none"> For programming and monitoring the ClassB headends from a PC, either locally or remotely via modem. Operation language (spanish, english) is automatically established in concordance with that used in Windows. Windows-based graphical interface. Use of preset memory allocations for repetitive ClassB assemblies. Stores complete headend information allowing reports to be printed. Shipped in CD-ROM. 	

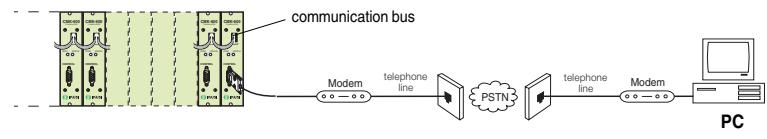

Minimum Requirements for the Computer

Computer	INTEL Pentium III 600MHz IBM PC or similar
Telephone line	Installed (for remote operation)
Modem at the headend location	Installed (for remote operation) — RS-232C port
Modem at the computer location	Installed (for remote operation)
Computer configuration	
Hard disc	100 MB free space
CD-ROM Drive	Installed
Parallel Port	IBM PC compatible printer port
Serial Port	COM1 port, RS-232C
Mouse	Installed
RAM	256 MB
Display	SVGA monitor, 15" or 17"
Operating System	Windows 95/98/ME/NT/2000/XP
Screen Properties' Configuration	800x600 pixels or 1024x768 pixels 256 colours Small size fonts

• Local Programming with PC + PRG-300

It is advisable to interconnect by means of BUS-013 jumpers the IKUSUP front panel sockets of the modules. The established communication bus enables to set the complete headend through a unique connection to the DB-9 socket of the last module on the right of the cascade.

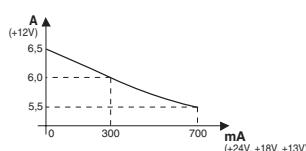

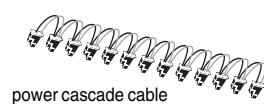

• Remote Programming with PC + PRG-300

Communication with the PC is accomplished through modems and telephone lines. In the headend, a communication bus must be built using BUS-013 jumpers. The modem at the headend side is connected to the DB-9 socket of the last module on the right of the cascade.

► ClassB HEADENDS

Power Supply

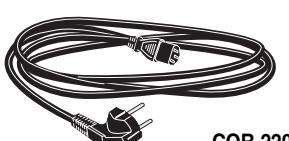

Model		CFK-700	
Reference		4501	
Regulation type		switch mode	
Mains supply voltage (50/60 Hz)	VAC	100 - 240 ($\pm 10\%$)	
Outputs		+12 V (6.5A) (*) → For ClassB modules +24 V (60 mA) → For mast-head preamplifiers +18 V (300 mA) +18 V / 22 kHz (300 mA) +13 V (300 mA) +13 V / 22 kHz (300 mA)	LNB remote powering
Max total currents of +24, +18 and +13 V	mA	700	
Efficiency	%	75	
Dimensions	mm	130 x 60 x 290	

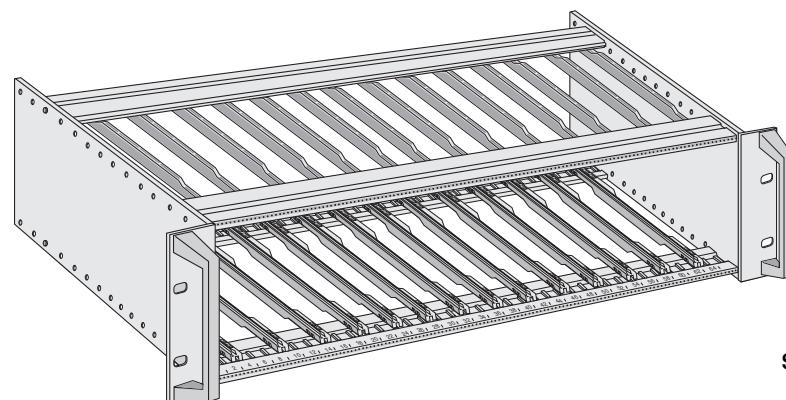

(*) The +12 VDC output can supply up to 6.5 A if there is not any load on the rest of the outputs. If there is load, the available current from +12 VDC falls as shown in the left graph.

- Mains lead NOT INCLUDED. The module has a 3-pin european standard inlet, so the mains lead to be used must have a mating CEE 22 socket (see COR-220 power cord below).
- Electrical safety protection level: Class II.
- 1 *power cascade cable* is supplied to connect the +12 Vdc voltage to all the ClassB modules mounted in the SMR-300 subrack.
- 2 "banana" jumpers, 50 cm length, are supplied to connect the appropriate outputs of the power supply to 1 or 2 ClassB demodulators for line powering of preamplifiers or LNB's.

Installation Accessories

Model	Ref.	Description
BUS-013	4430	Pack containing 11 jumpers for IKUSUP communication bus between ClassB modules (PC programming application).
CDB-200	4706	Two DB-9 female connectors to assemble the PC↔headend connecting cable.
CDP-102	4704	2-pair shielded, twisted cable (1 m) to assemble the PC↔headend connecting cable.
COR-220	3616	Europe Schuko power cord. Cordset consist of 1.5 m of harmonised cable with a CEE 22 moulded socket on one end and a moulded plug on the other.
OMR-300	4512	3U - 6E (130x30mm) blank panel to fill the unoccupied places on the SMR-300 subrack.
SMR-300	4511	19" Subrack Kit for ClassB assemblies, 3U height and 275 mm depth. Capacity: 1 power supply plus 12 modulators or demodulators. Includes 28 module guides.

► ClassB HEADENDS

«TDF» — Free-To-Air Digital Terrestrial TV Demodulation Equipment

DVB
Digital Video
Broadcasting

CE

TDF HEADENDS

- Digital-to-Baseband Demodulation Process (COFDM → Video & Stereo/Dual Audio). Input signal: Standard EN 300 744.
- Selectable colour system (PAL, SECAM, NTSC) and line, raster and subcarrier frequencies for the video baseband output signal.
- A TDF headend includes as many demodulators as free-to-air TV stations to be treated.

FUNCTIONAL DESCRIPTION OF THE TDF DEMODULATORS

A TDF demodulator carries out a complete demodulation process:

- tunes a COFDM digital channel,
- selects a clear TV programme from the multiplex received, and
- delivers the corresponding baseband video and audio signals.

Programming of the module involves the following settings:

- Central Input Frequency (125 kHz increments).
- Bandwidth (6, 7 or 8 MHz).
- Hierarchy Level (high or low priority).
- TV Programme and Audio Service.
- Colour System, Colour Subcarrier Frequency and Line and Raster Frequencies for the Video Baseband Signal.
- Level of the Output Audio Signal.
- Image Format, if the original format is 16:9. The possible conversions are 16:9 to 4:3 Pan&Scan or 16:9 to 4:3 Letter-Box.

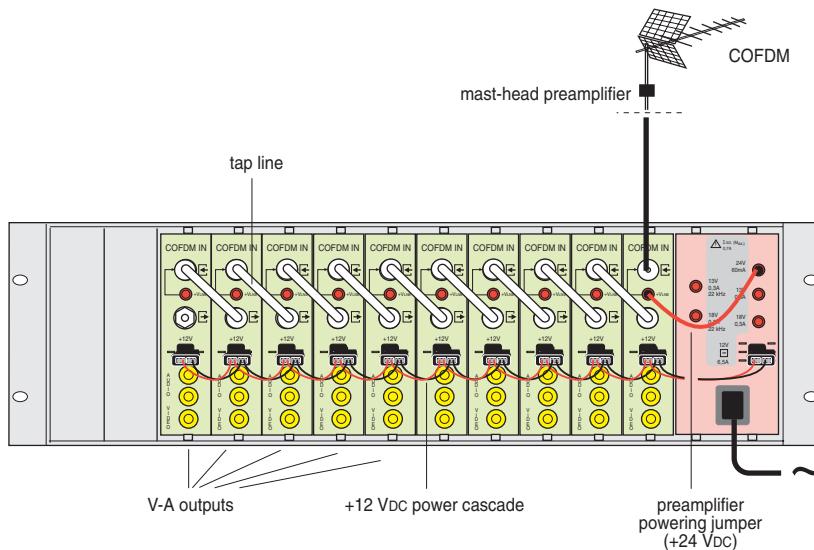

TDF-102

Simple cabling of TDF headends

All connections are made at the rear side of the headend. The TDF demodulators feature two directionally coupled input ports. Antenna signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. Video and audio outputs are available on RCA connectors (1 video and 2 audio).

For power connection each module has two blade terminals that allow to build a +12 VDC cascade using the power cascade cable furnished with the CFK-700 power supply. A banana socket located between the two input connectors is available to connect the feedline voltage for an optional mast-head preamplifier.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

— Rear view of a «TDF» headend for ten clear digital TV stations. Contains 10 Demodulators and 1 Power Supply, all fixed in the SMR-300 Subrack.

	Programming Interface		RS 232 / DB-9
	IKUSUP bus connector		(2x) 4-pin socket
	Dimensions	mm	130 x 30 x 290

⁽¹⁾ When selecting mono audio services, the audio output baseband signal is available on each one of the two audio connectors (L and R).

- The module is packed with 1 F plug bridge, 38 mm length, for input tap line.

(RCA plugs for video and audio output connections are not supplied)

► ClassB HEADENDS

«SDF» — Free-To-Air Digital Satellite TV Demodulation Equipment

DVB
Digital Video
Broadcasting

CE

SDF HEADENDS

- Digital-to-Baseband Demodulation Process (QPSK → Video & Stereo/Dual Audio). Input signal: Standard 300 421.
- Selectable colour system (PAL, SECAM, NTSC) and line, raster and subcarrier frequencies for the video baseband output signal.
- An SDF headend includes as many demodulators as free-to-air TV stations to be treated.

FUNCTIONAL DESCRIPTION OF THE SDF DEMODULATORS

An SDF demodulator carries out a complete demodulation process:

- tunes a QPSK Sat-IF digital channel,
- selects a clear TV programme from the multiplex received, and
- delivers the corresponding baseband video and audio signals.

Programming of the module involves the following settings:

- Central Input Frequency (1 MHz increments).
- Input Symbol Rate (0.001 MS/s increments).
- TV Programme and Audio Service. (Or a Radio Programme. Image will be black).
- Colour System, Colour Subcarrier Frequency and Line and Raster Frequencies for the Video Baseband Signal.
- Level of the Output Audio Signal.
- Image Format, if the original format is 16:9. The possible conversions are 16:9 to 4:3 Pan&Scan or 16:9 to 4:3 Letter-Box.

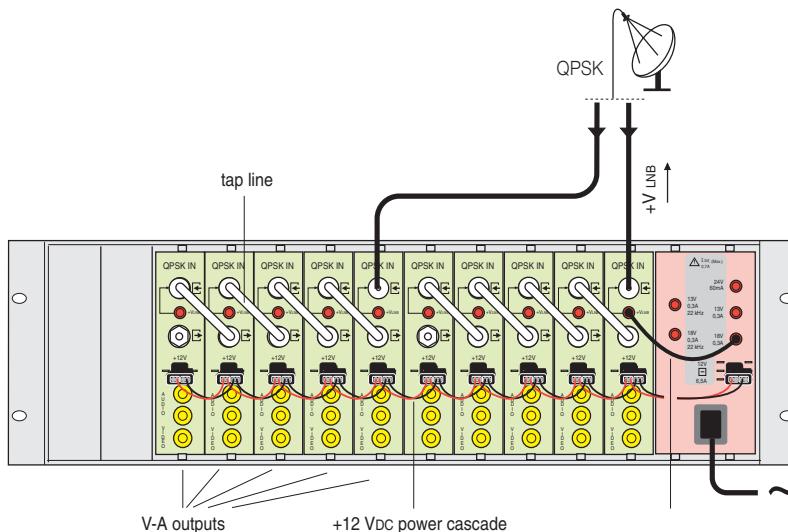

SDF-102

Simple cabling of SDF headends

All connections are made at the rear side of the headend. The SDF demodulators feature two directionally coupled input ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. Video and audio outputs are available on RCA connectors (1 video and 2 audio).

For power connection each module has two blade terminals that allow to build a +12 VDC cascade using the power cascade cable furnished with the CFK-700 power supply. A banana socket located between the two input connectors is available to connect the feedline voltage for the attached LNB.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

- Rear view of a «SDF» headend for ten clear digital TV stations; five stations arrive via a down lead cable and the other five ones via another. Contains 10 Demodulators and 1 Power Supply, all fixed in the SMR-300 Subrack.

«SDE» — Demodulation Equipment with Embedded CA for Digital Sat TV

DVB
Digital Video
Broadcasting

CE

SDE HEADENDS

- Satellite TV reception, standard DVB-S / MPEG-2 (EN 300 421).
- De-encryption and Digital-to-Baseband Demodulation Process (Encrypted QPSK → Video & Stereo/Dual Audio)..
- Selectable colour system (PAL, SECAM, NTSC) and line, raster and subcarrier frequencies for the video baseband output signal.
- An SDE headend includes as many Embedded CA (Conditional Access) demodulators as there are encrypted TV stations.

FUNCTIONAL DESCRIPTION OF THE SDE DEMODULATORS

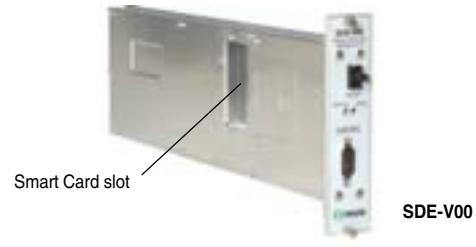

An SDE embedded CA demodulator carries out a complete demodulation process:

- tunes a QPSK Sat-IF digital channel,
- selects an encrypted TV programme from the multiplex received, and
- de-encrypts it and delivers the corresponding baseband video and audio signals.

A lateral slot is available to insert the operator's smart card.

Programming of the module involves the following settings:

- Central Input Frequency (1 MHz increments).
- Input Symbol Rate (0.001 MS/s).
- TV Programme and Audio Service. (Or a Radio Programme. Image will be black).
- Colour System, Colour Subcarrier Frequency and Line and Raster Frequencies for the Video Baseband Signal.
- Level of the Output Audio Signal.
- Image Format, if the original format is 16:9. The possible conversions are 16:9 to 4:3 Pan&Scan or 16:9 to 4:3 Letter-Box.

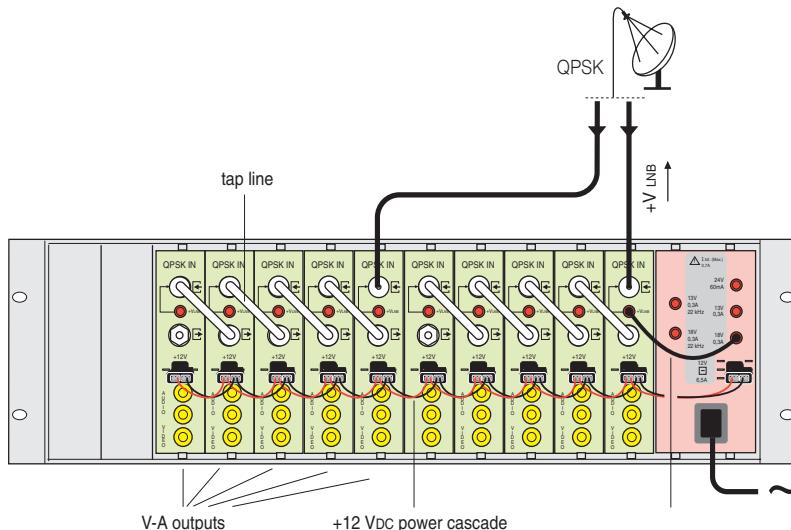

SDE-V00

Simple cabling of SDE headends

All connections are made at the rear side of the headend. The SDE demodulators feature two directionally coupled input ports. Sat-IF signal can therefore be directly fed into the input port of the first module, which in turn passes it through the coupler to the next and so forth. Video and audio outputs are available on RCA connectors (1 video and 2 audio).

For power connection each module has two blade terminals that allow to build a +12 VDC cascade using the power cascade cable furnished with the CFK-700 power supply. A banana socket located between the two input connectors is available to connect the feedline voltage for the attached LNB.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

— Rear view of a «SDE» headend for ten encrypted digital TV stations. Five stations arrive via a down-lead cable and the other five ones via another. Contains 10 Demodulators and 1 Power Supply, all fixed in the SMR-300 Subrack.

«CMK» — Vestigial Side Band TV Modulators

CE

- VSB TV Modulators. Mono and A2 Stereo/Dual Sounds. TV Systems: B/G, D/K, I, L, M/N.
- IF modulation and SAW filtering. Adjacent channel operation. Double SAW filter, for a very high VSB selectivity.
- Frequency agility. Any selectable TV channel within the 45-862 MHz band. PLL frequency synthesized.
- TV-channel output either through an only port (level: 104 dB μ V) or, on request, through two "looped" ports (level: 92 dB μ V).
- Built-in test pattern generator.
- Stand-by function that allows to establish a low-consumption status for the spare modulators in "remote programming" application.
- Operation shown by LEDs.

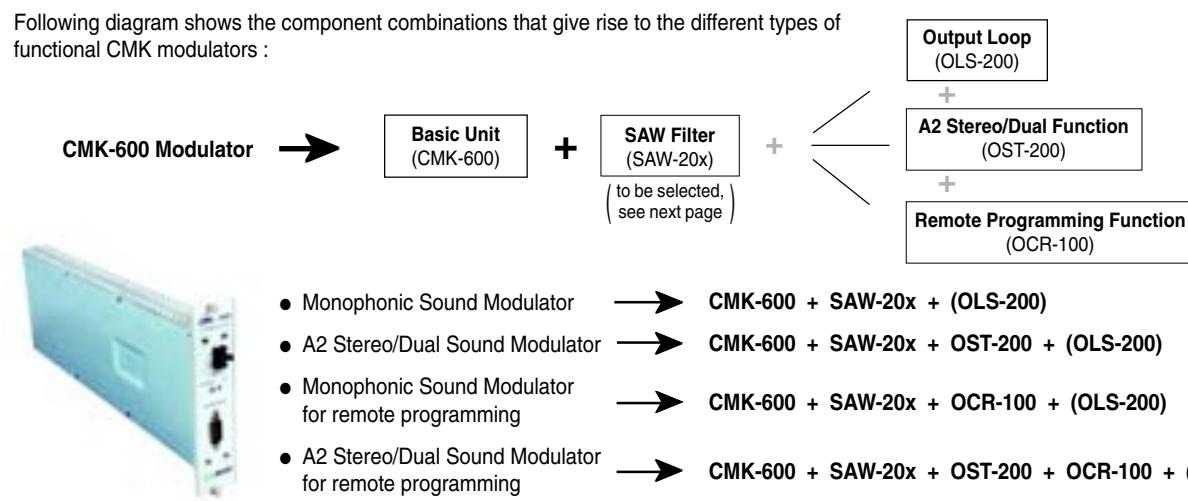

The CMK family — Composition of the CMK Modulators

The CMK family includes five different components to make up **CMK** modulators :

- The Basic Unit,
- the SAW Filter,
- the Output Loop,
- the A2 Stereo/Dual Function, and
- the Remote Programming Function.

The **Basic Unit** is the main component of the family. Inside it a factory-installable **SAW Filter** must be compulsorily installed. The other three components —**Output Loop**, **A2 Stereo/Dual** function and **Remote Programming** function—are optional and factory-installable too. So, the order for a CMK modulator must specify the basic unit and the other appropriate components that are required for the desired functionality (see ordering examples on next page).

Following diagram shows the component combinations that give rise to the different types of functional CMK modulators :

► ClassB HEADENDS

«CMK» — Vestigial Side Band TV Modulators

(cont'd)

COMPONENTS

Modulator Basic Unit	CMK-600 Ref. 4507	Output Loop	OLS-200 Ref. 4516								
● Main component. Is not functional by itself.			● Factory-installable into the basic unit. Characterizes the CMK modulator with two directionally coupled RF output ports, so an RF coupling line can be installed in the CMK headend.								
Double SAW Filters											
● Indispensable complement for the basic unit. The filter chosen determines the operating TV System. Factory-installable into the basic unit.			● Factory-installable into the basic unit. Provides stereo/dual functionality (A2 system). Only applicable for B/G and D/K systems.								
<table border="1"> <thead> <tr> <th>TV System</th> <th>SAW Filter</th> </tr> </thead> <tbody> <tr> <td>B / G</td> <td>SAW-200 (Ref. 2622)</td> </tr> <tr> <td>D / K / I / L</td> <td>SAW-201 (Ref. 2623)</td> </tr> <tr> <td>M / N</td> <td>SAW-203 (Ref. 2625)</td> </tr> </tbody> </table>				TV System	SAW Filter	B / G	SAW-200 (Ref. 2622)	D / K / I / L	SAW-201 (Ref. 2623)	M / N	SAW-203 (Ref. 2625)
TV System	SAW Filter										
B / G	SAW-200 (Ref. 2622)										
D / K / I / L	SAW-201 (Ref. 2623)										
M / N	SAW-203 (Ref. 2625)										
A2 Stereo/Dual Function			OST-200 Ref. 4510								
● Factory-installable into the basic unit. With this function implemented, the modulator becomes remote-controlled. Also required in modulators to be locally PC-programmed.			OCR-100 Ref. 4509								

MODULATORS' ORDERING EXAMPLES

a) B/G System, Mono Sound Modulator :

- 1 CMK-600 (Ref. 4507)
- 1 SAW-200 (Ref. 2622)

b) B/G System, A2 Stereo/Dual Sound Modulator, with Output Loop :

- 1 CMK-600 (Ref. 4507)
- 1 SAW-200 (Ref. 2622)
- 1 OST-200 (Ref. 4510)
- 1 OLS-200 (Ref. 4516)

c) D/K System, A2 Stereo/Dual Sound Modulator, with Remote Programming Function and Output Loop :

- 1 CMK-600 (Ref. 4507)
- 1 SAW-201 (Ref. 2623)
- 1 OST-200 (Ref. 4510)
- 1 OCR-100 (Ref. 4509)
- 1 OLS-200 (Ref. 4516)

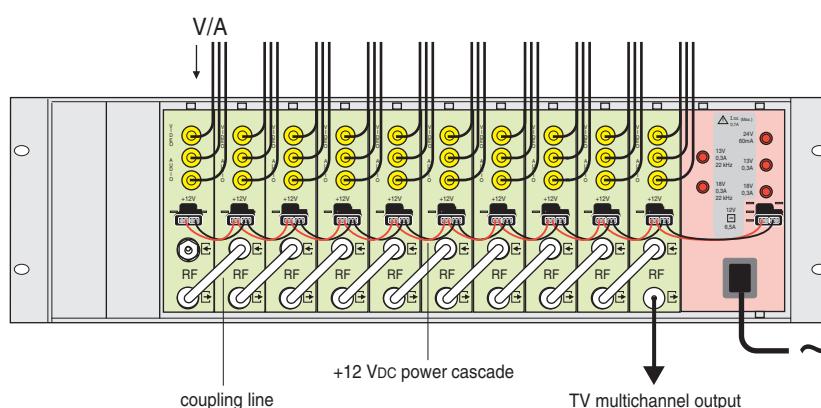

Connections on the CMK headend

Video and audio input ports are RCA type. The TV channel output is disposed in each modulator either on two "looped" F ports or on a unique F port, depending on the Output Loop option is or not implemented. For power connection, each module has two blade terminals that allow to build a +12 VDC cascade using the power cascade cable supplied with the CFK-700 power supply.

Local programming is carried out either with the SPI-300 unit, which is connected to each module individually, or with a PC + PRG-300 software. Remote programming is carried out through modems, with a PC + PRG-300 software.

The process involves the following selections and settings:

- Video Carrier Frequency
- TV System
- Video Modulation Depth
- Audio Modulation Deviation
- Carrier Level Ratio
- Audio Mode (mono-stereo-dual)
- RF Output Level
- Stand-by function
- Generation of Video Test Signal

— Rear view of a «CMK» headend with 10 Modulators and 1 Power Supply, all fixed in the SMR-300 Subrack. (All the modulators have the Output Loop option implemented).

DVB→IP Streamers — Range and General Features

Streaming Modules for ClassA Headends

The IP Streamers from IKUSI are DVB to IP gateways designed to broadcast in multicast on an IP network the services (TV or Radio programmes) issued from digital satellite, terrestrial or cable reception, or from professional DVB equipment. The IP streams can be viewed using an IPTV set-top box or a software video player.

The streamers have IKUSI ClassA mechanical format. As such, they are fixed on the BAS-700 / BAS-900 baseplates or in the SMR-600 rack frame, and they are +12 VDC powered from a CFP module (see pages 45 and 46).

Range includes the following models:

- **TNS-100.** Free-to-air DVB-T reception.
- **SNS-100.** Free-to-air DVB-S reception.
- **SNS-101.** MultiCrypt DVB-S reception. Common Interface.
- **CNS-100.** Free-to-air DVB-C reception. (Being developed).
- **ANS-100.** DVB-ASI to IP conversion. (Being developed).
- **BNS-200.** Input: Video/Audio baseband. Double. (Being developed).

Features

- Input: 1 DVB transport stream (MPTS). Output: up to 8 simultaneous IP-encapsulated programmes with individual multicast addresses.
- Filtering of information contained in the MPEG-2 tables.
- UDP and RTP transmission protocols.
- Web interface for module configuration.
- SAP and SDP protocols to facilitate automatic programme selection in the set-top box and to provide programme information to external servers.

ADVANCED FEATURES

- PID filtering
- PSI/SI parsing
- ECM and EMM transparent passthrough
- Regeneration of PAT and PMT tables
- Passthrough or blockade of CAT, NIT, SDT, EIT and TDT tables
- QoS marking configurable
- TTL configurable

Configuration of streamers is carried out through a web browser running on a PC provided with Ethernet adapter.

Abbreviations

ASI	: Asynchronous Serial Interface. Serial transmission method for MPEG-2 streams.
CAT	: Conditional Access Table
ECM	: Entitlement Control Messages
EIT	: Event Information Table
EMM	: Entitlement Management Messages
IPTV	: Internet Protocol Television
MPTS	: Multiple Program Transport Stream
NIT	: Network Information Table
PAT	: Program Association Table
PID	: Packet IDentifier
PMT	: Program Map Table
PSI	: Program Specific Information
QoS	: Quality of Service
RTP	: Real-Time Transport Protocol
SAP	: Service Advertisement Protocol
SDP	: Session Description Protocol
SDT	: Service Description Table
SI	: Service Information
SPTS	: Single Program Transport Stream
TDT	: Time and Date Table
TTL	: Time to Live
UDP	: User Datagram Protocol

Simple assembly and cabling of ClassA Streaming Headends

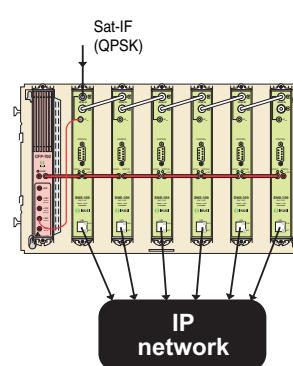

A ClassA Streaming Headend includes as many streaming modules as there are DVB channels whose services (TV or Radio programmes) you want to broadcast on the IP network, and one or more power supplies. The modules are simple to place on the wall-fixing baseplates or rack-frames available for ClassA headends.

The loop-through input configuration of the streamers allows to build a tap line by using the F plug bridges supplied. It suffices therefore to feed the DVB signal into the first module of the headend. Two DC sockets at each module facilitate, on the other hand, the constitution of the +12 VDC power cascade by using the DC plug bridges supplied as well.

The RJ-45 output ports of the headend —one port per streamer— feed the IP network with up to $8 \times n$ IP-encapsulated programmes, being n the number of streaming modules installed in the headend.

— Wall-fixing SNS Headend

«TNS» — DVB-T to IP Streaming Equipment

DVB-T → IP Streamer

TNS-100

Model		TNS-100	
Reference		5102	
Reception		FTA DVB-T	
Input Section (COFDM)	Frequency range	MHz	174 - 230 and 470 - 862
	Frequency step	kHz	125
	Input level	dB μ V	35 ... 100
	Input loop-through gain	dB	0.5 (± 1)
Output Section (IP)	Standard		IEEE 802.3 10/100 BaseT
	Bit rate	Mbps	up to 100
	Transmission protocols		UDP / RTP
	No. of simultaneous streams		up to 8
	Multicast		Yes
Connectors	RF input (loop-through)		(2x) female F
	DC connection		"banana" socket
	Configuration		RS 232 / DB-9
	Ethernet output		RJ-45
General	Supply voltage	VDC	+12
	Consumption	mA	420
	Indicator leds		ON - STATUS - LINK - ACT
	Operating temperature	°C	0 ... +45
	Dimensions	mm	230 x 195 x 32

- The module is packed with:

- 1 F plug bridge, 64 mm length, for input tap line.
- 1 DC plug bridge, 53 mm length, for connection of +12 VDC voltage.

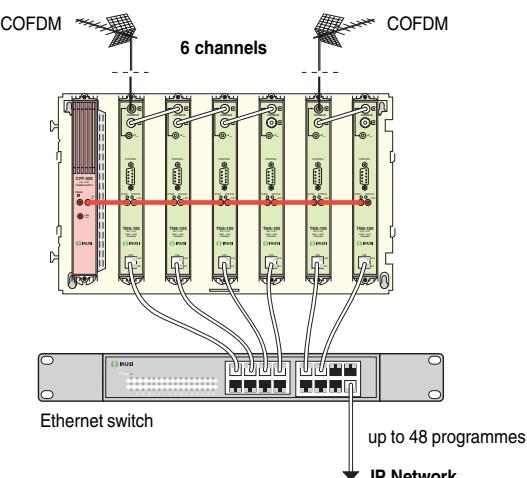

TNS Headends

A TNS headend for DVB-T to IP streaming includes:

- As many TNS-100 Streamers as there are DVB-T channels (transport streams) whose programmes you want to broadcast on the IP network.
- One or more CFP Power Supplies.
- One or more Rack-frames or Baseplates. The baseplates can be horizontally joined.
- Usually, one housing unit.

The TNS modules have two directionally coupled input ports that facilitate simple connection of the incoming COFDM-modulated signal using the plug bridges supplied. For power connection each module has two DC banana sockets that allow to build the +12 VDC cascade from the power supply module. A third banana socket is available to connect the power for an optional mast-head preamplifier.

- Example of TNS headend for six digital terrestrial TV channels. Contains 6 TNS-100 streamers and 1 CFP-500 power supply, all fixed on 1 BAS-700 baseplate.

«SNS» — DVB-S to IP Streaming Equipment

DVB-S → IP Streamers

SNS-100

SNS-101

Model	SNS-100		SNS-101
Reference	5100		5101
Reception		FTA DVB-S	MultiCrypt DVB-S (Common Interface)
CAMs supported		—	Conax, Cryptoworks, Irdeto, KeyFly, Mediaguard, Nagravision, Viaccess, ...
Input Section (QPSK)	Frequency range	MHz	950 - 2150
	Frequency step	MHz	1
	Input level	dBm	-65 ... -25
	Input loop-through gain	dB	0 (± 3)
	Input symbol rate	MS/s	2 ... 45
Output Section (IP)	Standard	IEEE 802.3 10/100 BaseT	
	Bit rate	Mbps	up to 100
	Transmission protocols	UDP / RTP	
	No. of simultaneous streams	up to 8	
	Multicast	Yes	
Connectors	RF input (loop-through)	(2x) female F	
	DC connection	"banana" socket	
	CAM entrance	—	slot
	Configuration	RS 232 / DB-9	
	Ethernet output	RJ-45	
General	Supply voltage	VDC	+12
	Consumption	mA	260 480 (CAM included)
	Indicator leds	ON - STATUS - LINK - ACT	
	Operating temperature	°C	0 ... +45
	Dimensions	mm	230 x 195 x 32

- Each module is packed with:

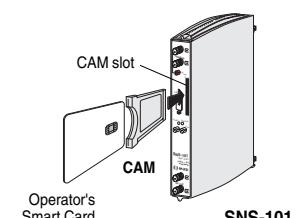

- 1 F plug bridge, 64 mm length, for input tap line.
- 1 DC plug bridge, 53 mm length, for connection of +12 VDC voltage.

SNS Headends

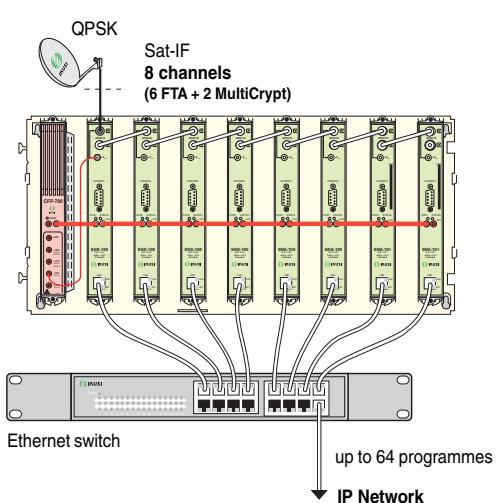

An SNS headend for DVB-S to IP streaming includes:

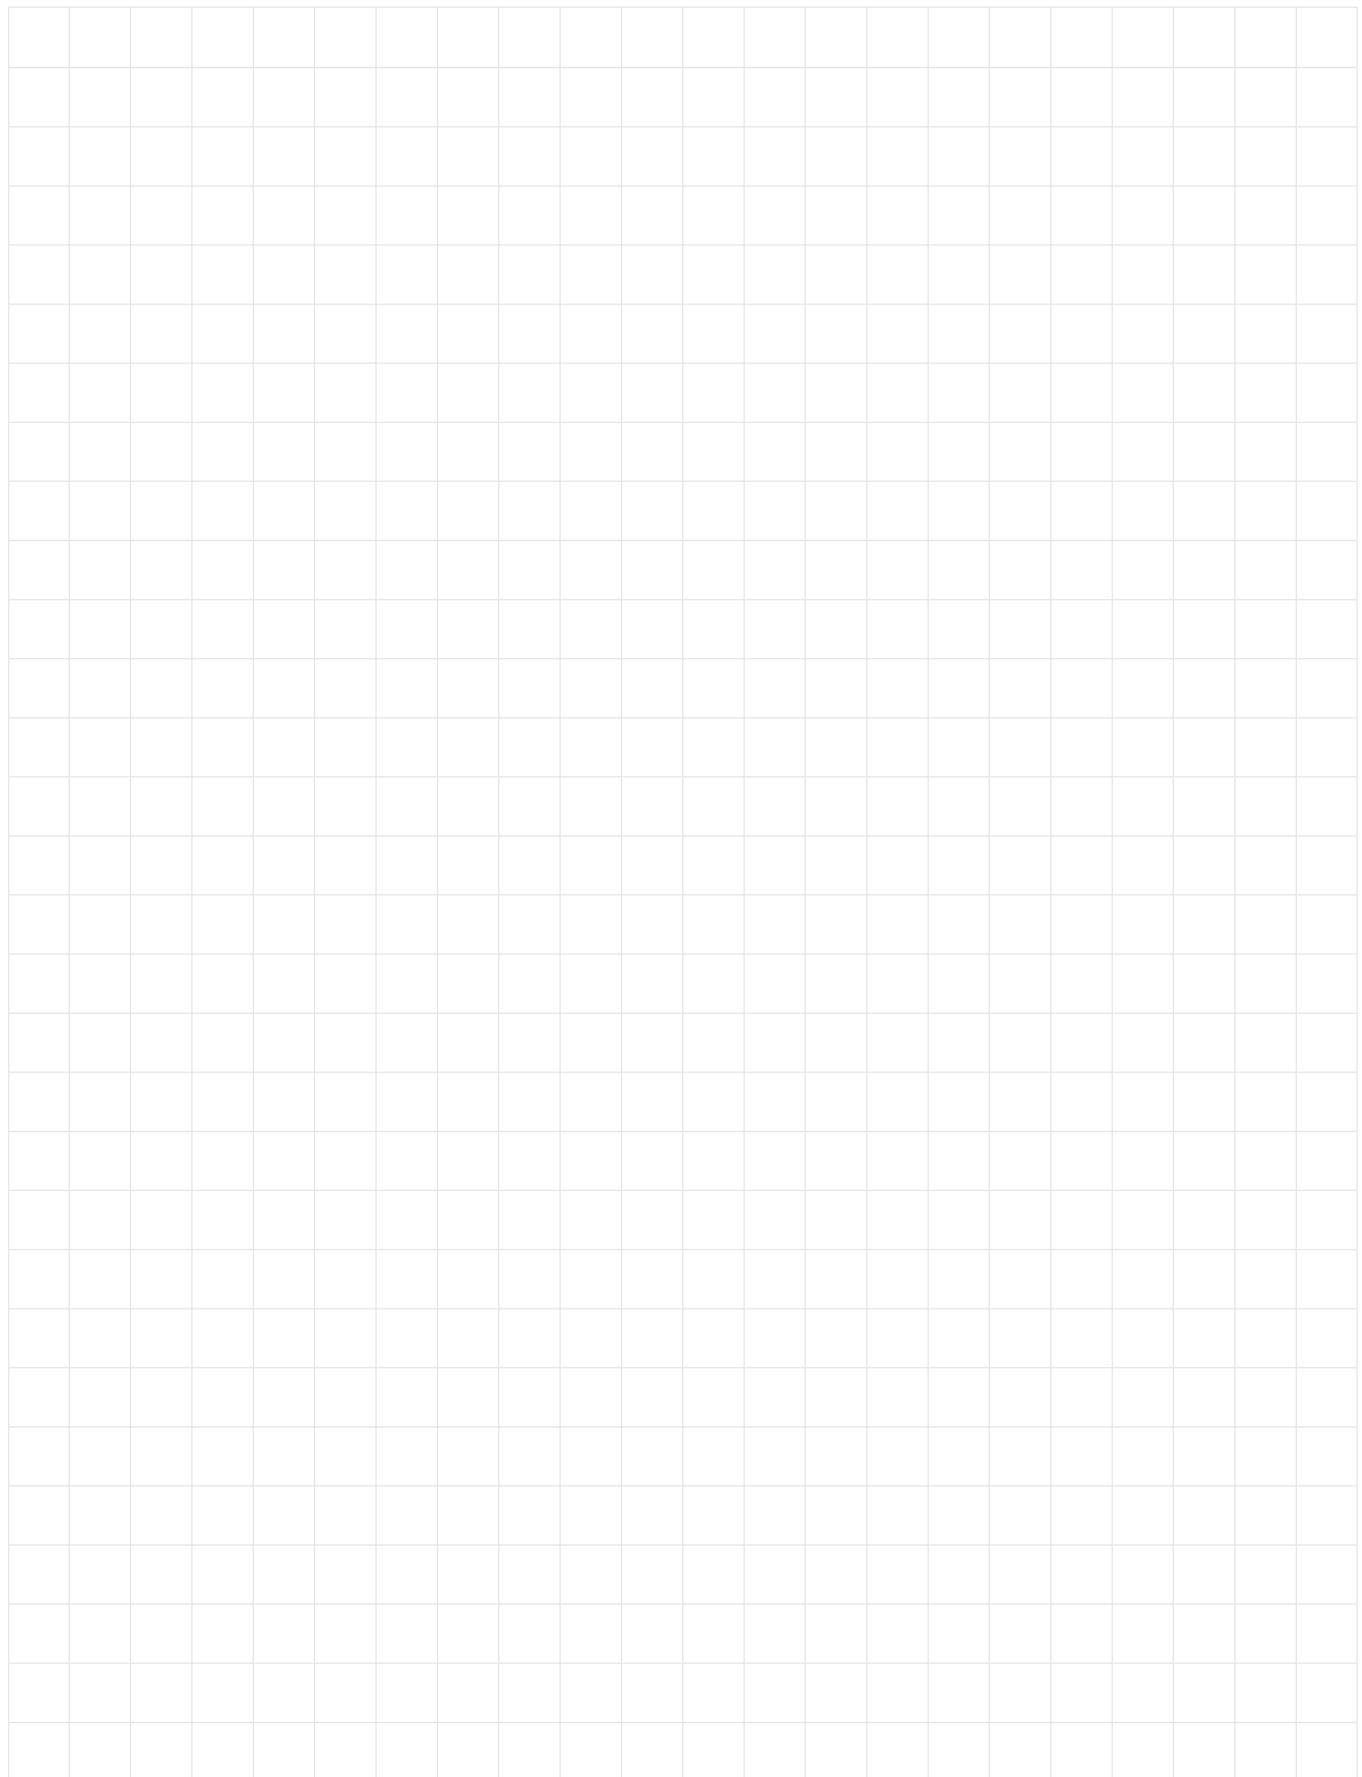

- As many SNS-100 or SNS-101 streamers as there are DVB-S channels (transport streams) whose programmes you want to broadcast on the IP network. The SNS-101 features Common Interface and must be utilized when the input DVB-S channel includes one or more encrypted programmes that you want to de-encrypt. A CAM (Conditional Access Module) containing the Operator's Smart Card must fit the front panel slot. CAM modules are not supplied by IKUSI.
- One or more CFP Power Supplies.
- One or more Rack-frames or Baseplates. The baseplates can be horizontally joined.
- Usually, one housing unit.

The SNS modules have two directionally coupled input ports that facilitate simple connection of the incoming QPSK-modulated signal using the plug bridges supplied. For power connection each module has two DC banana sockets that allow to build the +12 VDC cascade from the power supply module. A third banana socket is available to connect the power for the attached LNB.

— Example of SNS headend for eight digital satellite TV channels (six FTA's and two Multicrypt's). Contains 6 SNS-100, 2 SNS-101 and 1 CFP-700 power supply, all fixed on 1 BAS-900 baseplate.

► FIBRE OPTICS

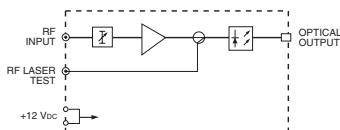

«FTD» — TV+SAT-IF Optical Transmitting Modules

- 1 RF input (45-2150 MHz) — 1 Optical output (1310 nm). Connection of singlemode type optical fibre.
- Solution for distribution of terrestrial TV and satellite IF signals (analog and digital) over large collective installations: residential districts, hotels, hospitals.
- Ultralineal, APC-controlled, 4 mW DFB (Distributed Feedback) Laser. Fully compatible with PAL, SECAM, NTSC, FM, DVB-S, DVB-T, DVB-C and other standards.
- An optical budget of 6 dB is available between the transmitter and the related FRD receivers. This equates to approximately 1 km where we are feeding three optical receive sites or up to 12 km for point to point links.
- DC powered by the CFP-500 or CFP-700 power supply modules. Mountable on baseplates or rack-frame of ClassA headend.

FTD-314

Block diagram

Model		FTD-314	
Reference		4902	
Optical output power		mW	4 (= 6 dBm)
RF input frequency		MHz	45 - 2150
Optical section	Optical wavelength	nm	1310 (± 20)
	Relative intensity noise (RIN) of laser	dB/Hz	< -150
	Optical output return loss	dB	> 55
	Optical output connector		SC / APC 8°
RF section	RF input level	dB μ V	94 ... 104

	Supply voltage	Vdc	+12
	Consumption	mA	160
	Operating temperature	°C	-10 ... +55
	DC connector type		"banana" socket
Dimensions		mm	230 x 195 x 32

• The module is packed with 1 DC plug bridge for +12 VDC power cascade.

«FSP» — Optical Splitting Modules

- 2- and 3-way optical splitters for singlemode fibre applications. 1310 nm / 1550 nm wideband operation.
- Mountable on baseplates or rack-frame of ClassA headend. The splitters share out the optical power of FTD transmitters to feed multiple field nodes, hence maximizing the use of optical transmission equipment.
- The units are reciprocal and can also be used to combine multiple return path fibres to feed one FRR return path receiving module.

ClassA Headend with 4 FTD-314 and 2 FSP-302, plus 1 CFP-700 Power Supply

Model		FSP-302	FSP-303
Reference		4904	4905
No. of optical outputs		2	3

• Each module is packed with 1 DC plug bridge for +12 VDC power cascade along the headend.

► FIBRE OPTICS

«FRD» — Compact TV+SAT-IF Optical Receiver

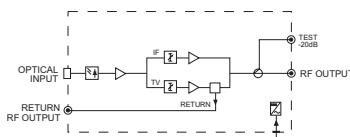

CE

- 1 optical input (1290-1600 nm) — 1 RF output (45-2150 MHz). Connection of singlemode type optical fibre.
- Passive return path: 5-30 MHz. Return signal output port to be connected to a return optical transmitter.
- Especially designed for the delivery of terrestrial TV and satellite IF signals (analog and digital) in one- or two-way networks.
- Low-noise PIN photodiode operating in the linear section of the "optical power - electrical current" transfer function. Excellent response to the PAL, SECAM, NTSC, FM, DVB-S, DVB-T, DVB-C and other standards.
- Mains powered, 50/60 Hz. Electrical safety protection level: Class II. Insertable power cord with bipolar plug.
- Injection-moulded zinc alloy housing. Wall-fixing.
- Indoor mounting. Grounding terminal.

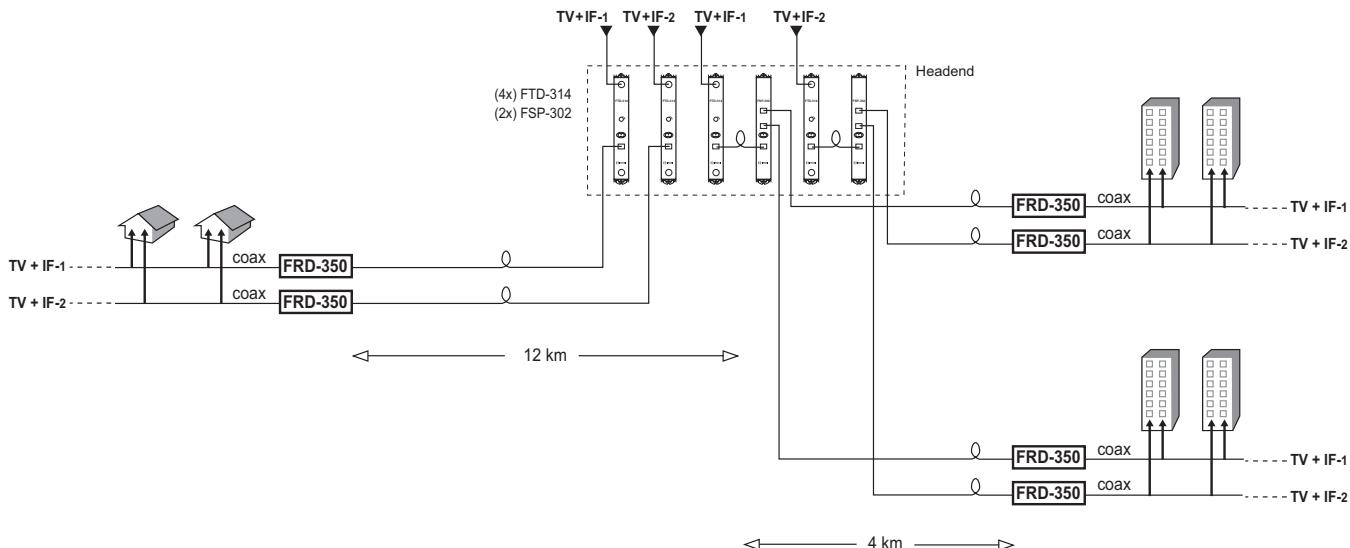

FRD-350

Block diagram

Model		FRD-350

► SAT-IF MULTISWITCHES

Application and Range

Just one cable for many satellite signals

The most rational way of distributing satellite signals to the subscribers of collective TV installations is to use systems based on multiswitches. These systems can be installed anywhere, afterwards the necessary LNBs (the number of which depends on how many satellites one want to receive) will be connected to the equipment installed. A single coaxial cable directly connected to a multiswitch will go to every home (or room) to be equipped with satellite receiver. This enables the users to choose a satellite/polarization independently one from another.

The family of IKUSI's multiswitches includes cascadeable and stand-alone versions to distribute 1 to 4 satellites to few or many users. Models for 8 and 16 polarizations support DiSEqC 2.0 commands.

«RC» - Cascadeable Multiswitches

«RC» is a cascadeable equipment intended for medium- and big-size collective installations (up to 1000 users) distributing 2 or 4 satellites plus terrestrial. Besides a complete range of multiswitches, which offer 4 tap levels that allow to maintain balance of the signal throughout the distribution backbone, the equipment includes launch and line amplifiers as well as multi-taps and multi-splitters.

(Pages 100-108)

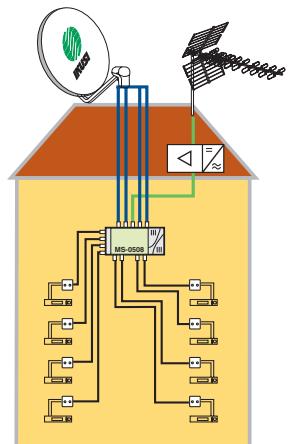

«MS» - Stand-Alone Multiswitches

The «MS» stand-alone multiswitches are intended for star distribution of 1, 2 or 4 satellites plus terrestrial to 4, 8, 12 or 16 users. The wide range —eleven models— assures an optimal solution for each particular installation attending to the number of satellites to be distributed and users to be served.

(Page 109)

This version includes four multiswitches for star distribution of 1 satellite plus terrestrial to 4, 8, 12 or 16 users. All feature high SAT input isolation.

(Page 110)

What is DiSEqC?

DiSEqC (Digital Satellite Equipment Control) was invented to make it possible to use more than one LNB (4 polarizations) with using just one cable. Basically, the DiSEqC uses the existing 22 kHz signal to send, via the coaxial cable, digital controlled signals from the receiver to the multiswitch. In order to implement the selection of a determined satellite polarization, the 22 kHz signal is modulated with the appropriate digital information. This information is sent very fast between the standard 22 kHz signal, what enables the compatibility with non-DiSEqC receivers which can in this way control the multiswitch, at least partially.

These are the main DiSEqC levels:

- *Mini-DiSEqC* or *ToneBurst*. It allows switching between 2 LNBs. The ToneBurst is out of the DiSEqC standard, but it is compatible with DiSEqC 1.0 and 2.0.
- *DiSEqC 1.0*. It allows switching between up to 4 LNBs. Therefore the user can watch programmes emitted by up to four satellites, whose signals can be received by up to four antennas.
- *DiSEqC 1.2*. As level 1.0 above plus the capability of controlling rotor-based dishes.
- *DiSEqC 2.0*. Adds bi-directional communication. This version enables easy installing of a satellite system.

DiSEqC is backwards-compatible, so a DiSEqC 2.0 receiver can work just fine with a DiSEqC 1.0 multiswitch.

►SAT-IF MULTISWITCHES

«RC» — Cascadeable Multiswitches Equipment

CE

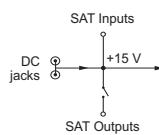

Launch Amplifier for 8 SAT-IF Polarizations

- Amplification of 8 SAT-IF polarizations for compensating distribution losses in 9-cable distribution systems. Two launch amplifiers can be used to amplify 16 SAT-IF polarizations in 17-cable systems.
- Cascadeable with multiswitches RC-9000 and other 9-cable system components.
- Continuous attenuation and equalization adjustments.
- Local DC powering using the PSU-015 power supply (see below). Power voltage stands on the 8 SAT input ports for line-powering LNBs and may be inserted on the 8 SAT output ports for line-powering possible RL-9100/9200 line amplifiers. Three LEDs inform about power connection and +15 VDC presence at the input and output ports.
- Indoor mounting. Wall fixing.

► SAT-IF MULTISWITCHES

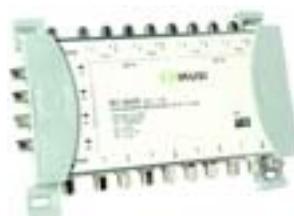

«RC» — Cascadeable Multiswitches Equipment

Cascadeable 9x4 Multiswitches

- Cascadeable multiswitches for 9-cable systems. Distribution of 8 Sat-IF polarizations and 1 Terrestrial-TV signal. Four tap lines per multiswitch.
- Remote powering from users' receivers. Active SAT and passive TERR.
- 4 models for 4 levels of tap loss. Sloped response for satellite frequencies.
- All models support DiSEqC 2.0 commands and are compatible with voltage/tone/ToneBurst switching signals.
- High isolation between polarizations by using multilayer technique.
- DC passing between input and output SAT lines.
- Indoor mounting. Wall fixing.
- SEE APPLICATION DIAGRAM ON PAGE 108.

Cascadeable 9x8 Multiswitches

- Cascadeable multiswitches for 9-cable systems. Distribution of 8 Sat-IF polarizations and 1 Terrestrial-TV signal. Eight tap lines per multiswitch.
- Remote powering from users' receivers. Active SAT and passive TERR.
- 4 models for 4 levels of tap loss. Sloped response for satellite frequencies.
- All models support DiSEqC 2.0 commands and are compatible with voltage/tone/ToneBurst switching signals.
- High isolation between polarizations by using multilayer technique.
- DC passing between input and output SAT lines.
- Indoor mounting. Wall fixing.
- SEE APPLICATION DIAGRAM ON PAGE 108.

Line Amplifiers for 8 SAT-IF Polarizations and 1 Terrestrial Signal

- Amplification of 8 SAT-IF polarizations and 1 Terrestrial-TV signal for compensating through losses of multiswitches, taps, splitters and interconnection cables in 9-cable distribution systems. Two line amplifiers can be used to amplify 16 IF and 1 TV signals in 17-cable systems.
- Cascadeable with multiswitches RC-9000 and other 9-cable system components.
- Two models for two levels of gain and RF power.
- Continuous attenuation adjustment. Fixed or adjustable slope response for satellite frequencies, depending on model.
- Line powering (+15 VDC) through input or output SAT lines, with passing switch. Also local powering using the PSU-015 power supply (see below). Three LEDs inform about power connection and +15 VDC presence at the input and output SAT ports.
- Indoor mounting. Wall fixing.
- SEE APPLICATION DIAGRAM ON PAGE 108.

Modular Launch SAT Amplification Equipment - 120 dB μ V

- Amplification of as many SAT-IF polarizations as required. One module SZB-190 per polarization. Application in 5-, 9- or 17-cable distribution systems for compensating distribution losses. SEE APPLICATION DIAGRAM OVERLEAF.
- Easy to assemble onto wall mounting baseplates with capacity for 6 or 9 modules. Two baseplates can be joined horizontally.
- Continuous attenuation adjustment. Fixed slope.
- Generation of voltage/tone signals for selection of H/V polarisation and high/low frequency sub-band.
- Power supply module. +24 VDC power voltage is automatically connected to the amplification modules through a connecting bar built in the baseplate.

► EXTENSION AMPLIFIERS

«TAE-500» – Active Return Path, 862 MHz Amplifiers

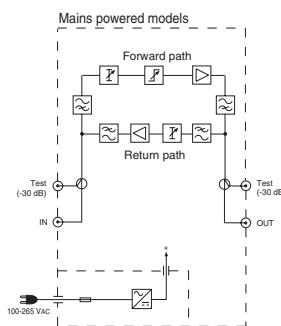

CE

- Distribution of television, sound and interactive multimedia signals.
- Ideal for hotels and dense multiple dwelling units.
- Forward path extends to 862 MHz. Active return path. Three available splits: 30/47 MHz, 42/54 MHz or 66/86 MHz.
- Output level: 124 dB μ V (DIN-B). Power Doubling technology.
- Continuous attenuation and equalization adjustments.
- Mains or line powering, 50/60 Hz. Electrical safety protection level: Class II. Switch-mode power supply.
- External 75Ω output test F ports –forward and reverse.
- Injection-moulded zinc alloy housing. Access to the adjustment elements through an easy-to-open frontal panel. F type connection. Wall-fixing. Outdoor mounting for the remote powered models (weatherproofing IP55 grade).
- Grounding terminal.

VERSIONS :

TAE-584 (Ref. 1560) : Features are those of the TAE-583 (Ref. 3207) plus slope adjustment control (0-16 dB) for return signal.

TAE-589 (Ref. 1561) : Features are those of the TAE-588 (Ref. 3208) plus slope adjustment control (0-16 dB) for return signal.

► EXTENSION AMPLIFIERS

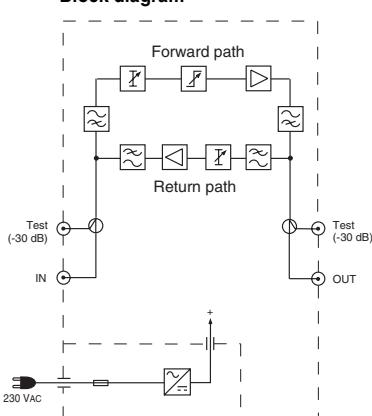

«TAE-700AR» — Active Return Path, 862 MHz Amplifiers

CE

- Forward path extends to 862 MHz. Active return path. Three available splits: 30/47 MHz, 42/54 MHz or 66/86 MHz.
- Output level: 118 dB μ V (DIN-B). Push-pull technology.
- Continuous attenuation and equalization adjustments.
- Mains powering, 50/60 Hz. Electrical safety protection level: Class II. Mains lead and plug included.
- External 75Ω output test F ports —forward and reverse.
- Injection-moulded zinc alloy housing. Access to the adjustment elements through an easy-to-open frontal panel. F type connection. Indoor mounting. Wall-fixing.
- Grounding terminal.

► EXTENSION AMPLIFIERS

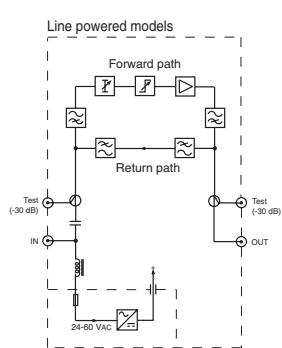

«TAE-900» — Passive Return Path, 862 MHz Amplifiers

CE

- Distribution of television, sound and interactive multimedia signals.
- Forward path extends to 862 MHz. Passive return path. Two available splits: 30/47 MHz or 55/86 MHz.
- Output level: 120 dB μ V (DIN-B). Push-pull technology.
- Continuous attenuation and equalization adjustments.
- Mains or line powering, 50/60 Hz. Electrical safety protection level: Class II. Switch-mode power supply.
- External 75Ω output test F ports —forward and reverse.
- Injection-moulded zinc alloy housing. Access to the adjustment elements through an easy-to-open frontal panel. F type connection. Wall-fixing. Outdoor mounting for the remote powered models (weatherproofing IP55 grade).
- Grounding terminal.

► EXTENSION AMPLIFIERS

«SAE» — Two-way, 2150 MHz Amplifiers

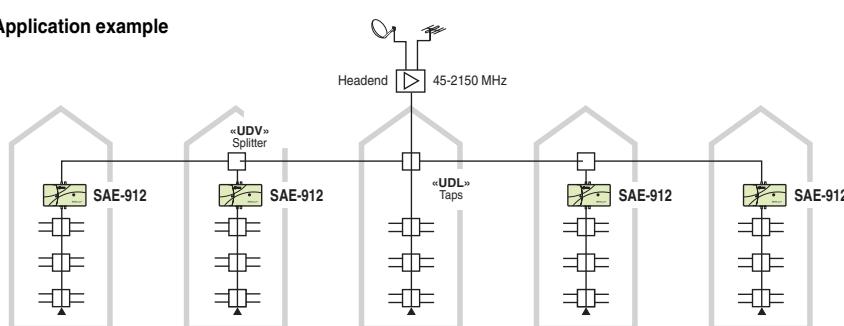

CE

- Distribution of terrestrial TV, satellite IF and multimedia signals.
- 1 RF input — 1 RF output. Terrestrial and satellite frequencies amplified separately, with push-pull technology used for terrestrial amplification. Passive or active return path, with respective 35/45 MHz or 65/86 MHz splits.
- Attenuation and equalization adjustments of TV and IF signals by potentiometer. In model with active return path, selection of return signal attenuation by the insertion of small plug-in links provided.
- 75Ω test ports for forward (TV+IF) and reverse output signals.
- Mains powering, 50/60 Hz. Operation shown by LED. Mains lead insertable into C8 type, 2-pin connection socket.
- Zinc alloy housing with protective cover for the adjustment controls. F connectors. Wall fixing.
- Indoor mounting. Grounding terminal.

► LINE AND DISTRIBUTION CATV AMPLIFIERS

«TAL-800» — Configurable Line and Distribution Amplifiers

CE

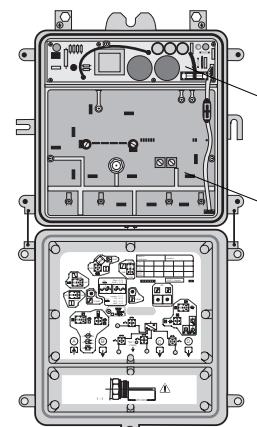

GENERAL DESCRIPTION

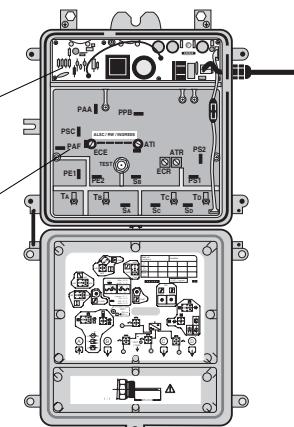

The line amplifiers «TAL-800» Series includes line and mains powered models for 862 MHz systems, with three available splits: 30/47 MHz, 42/54 MHz and 66/86 MHz. Advanced GaAsFET amplification technology is used providing excellent output levels at high channel capacities.

The «TAL-800» amplifiers come in a tough housing with drop-down front lid. The RF amplification block and the power supply are modular and can be taken out and replaced, when required, without removing the amplifier from its location and without the need of disconnection. Both modules are available as spare parts. At the bottom of the housing four separate 5/8" cable connections can be located (these are clearly shown in the picture above left); please note that alternatively both input and main output connections to the amplifier can be made to the side entry ports located at the bottom left and bottom right sides of the housing.

The amplifiers come fully optioned and do not require the purchase of additional modules, with the exception of the ALSC. By simply changing the internal plug-in links to the desired position, the amplifier can be configured to include a splitter or a tap at the input and output ports. Some of the other built in options are: add pre-amplification at the forward path, disable the return path, enable or disable both input and output power passing ports, just to name a few. An Automatic Level and Slope Control module, which will deliver a constant output level over temperature, can be simply plugged into the amplifier module if required.

Line Powered «TAL-800» Amplifier

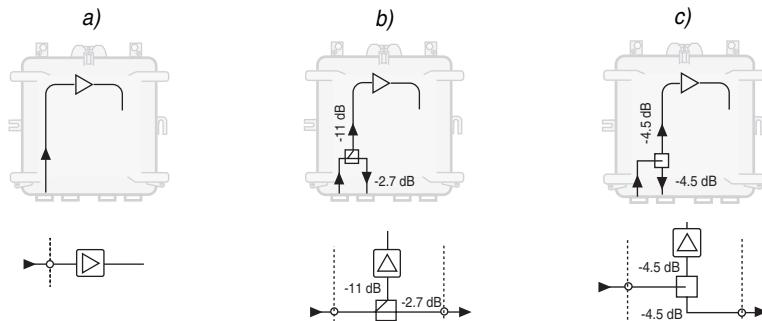

Mains Powered «TAL-800» Amplifier

- Aluminium die-cast housing with exceptional cooling characteristics. Weatherproofing IP67 grade and maximum RFI shielding. Stainless steel screws.
- Wall- and strand-fixing.
- Input and output RF connections by 5/8"—24 UNEF 2A pin connectors.
- Transient protected connection ports.
- Switch-mode power supply with automatic transient protection, output overvoltage protection and current limiting.
- 75 ohms test points on F type connectors.
- Earthing facility.

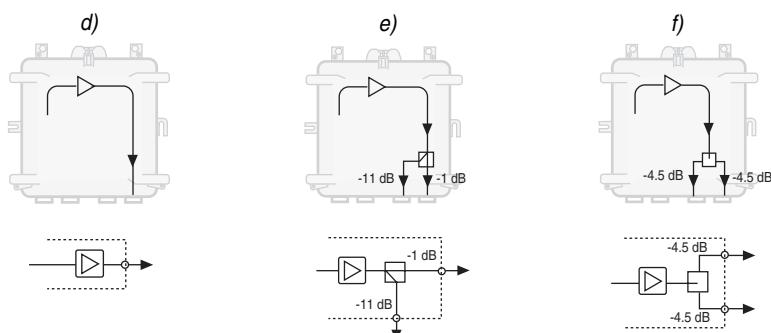

Input Configurations:

- a) No bypass
- b) Tap: bypass at -2.7 dB
- c) Splitter: bypass at -4.5 dB

Output Configurations:

- d) 1 port
- e) Tap: 2 asymmetrical ports
- f) Splitter: 2 symmetrical ports

«TAL-800» — Configurable Line and Distribution Amplifiers

(cont'd)

ALSC Circuit Card

To upgrade a «TAL-800» amplifier with ALSC (Automatic Level and Slope Control) function. Monitoring of 2 pilot carriers or 2 TV carriers selected from the system. This small module is simply plugged into the amplifier module of the TAL.

TMC-102

Model	TMC-102 (*)	
Reference	2898	
Reference signal	2 pilot carriers	
Lower carrier frequency between	MHz	47 and 130
Upper carrier frequency between	MHz	390 and 606, or 861.75
Automatic control range	dB	6
Forward signal output level stability	dB	± 0.5
Operating output level of the TAL-800	dBµV	90 - 100
Consumption	W	1.2

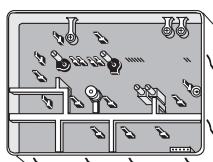

(*) The two control reference frequencies—lower and upper—must be indicated.

SPARE MODULES

Both amplifier and power supply modules for the TAL-800 are available separately as spare parts or standby modules. Replacement of such modules can be effected quickly and efficiently whenever the need arises.

Amplification Modules

Three different models related to the frequency splits (30/47 MHz, 42/54 MHz or 66/86 MHz).

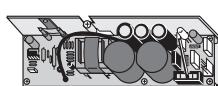

TMA-88x

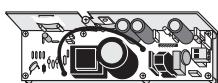

Model	TMA-883	TMA-884	TMA-886
Reference	3952	3953	3954
Mounting in the amplifier	TAL-883 / TAL-893	TAL-884 / TAL-894	TAL-886 / TAL-896
Dimensions	mm	167 x 123 x 27	
Packed weight	g	325	

Power Supply Modules

Two models, one for remote powered amplifiers and the other for mains powered amplifiers.

TMP-880

TMP-890

Model	TMP-880	TMP-890
Reference	3951	3971
Mounting in the amplifier	TAL-883 / TAL-884 / TAL-886	TAL-893 / TAL-894 / TAL-896
Dimensions	mm	167 x 35 x 45
Packed weight	g	225

INFORMATION TO ORDER «TAL-800» AMPLIFIERS

If ALSC is required, the order needs to include the TMC-102 module.

- The following is an example for 1 amplifier TAL-886 with ALSC function controlled by two pilots of 125.75 MHz and 535.25 MHz:

1 TAL-886 - (Ref. 3950)

1 TMC-102 (125.75 MHz - 535.25 MHz) - (Ref. 2898)

► LINE AND DISTRIBUTION CATV AMPLIFIERS

TSI-500 — AC Power Supply / Power Inserter - RF Configurable

CE

The TSI-500 is a «power supply/power inserter» that may be RF configurable as *single inserter*, *2-way splitter* or *1-port tapoff*. Inserts a 60 VAC voltage to any of the coaxial cables connected to the unit —two cables when it is used as single inserter or three cables in the splitter or tapoff configurations.

The unit is presented in a tough aluminium die-cast housing for outdoor mounting. A neoprene compression gasket and a neoprene/metal-mesh radiation gasket provide maximum RFI shielding and IP67 grade weatherproofing. RF ports are 5/8"-24 type.

- Three fuses/switches for AC insertion to one, two, or the three RF ports.
- Built-in protection for overcurrents taking place when the unit is switched-on.
- Input and output fuses with status LED indicators.
- Output overvoltage VDR protection.
- Wall fixing.
- Grounding and sealing facilities.

AC Power Supply / Power Inserter

Model	TSI-500	
Reference	2179	
Bandwidth	MHz	5 – 862
Nominal mains supply	VAC	220 / 240
Nominal inserted voltage (at max load)	VAC	58
Impedance	Ω	75
Return loss	dB	>16
Max insertion loss	«single inserter» configuration	0.6
	«splitter» configuration	(2x) 4.5
	«tapoff» configuration	1.6 and 12
Response flatness	dB	≤ ±0.5
Max current to one RF port	A	5
Max current to all RF ports	A	5
Hum modulation	dB	≤ -70
Efficiency	%	90
Load regulation	%	0 ... -6
Screening factor	dB	>80
Fuse/switch of AC injection		(3x) Semi-delay 6.3A / 250V
Fuse of transformer primary		T 3.15A / 250V
Fuse of transformer secondary		T 6.3A / 250V
AC requirements	VA	330
Operating temperature range	°C	-20 ... +70
Outside dimensions	mm	300 x 200 x 100
Packed weight	kg	5.980

► RETURN TV MODULATORS

MVR-600 — 12-65 MHz VSB TV Modulator

CE

- Applicable in two-way coax networks. The MVR-600 is installed in the site where the signal to be transported to the headend is generated.
- Vestigial Side Band. Mono Audio (A2 Stereo option is available). System B.
- IF modulation and SAW filtering. Adjacent channel operation.
- Frequency agility. Any selectable channel within the 12-65 MHz band.
- Built-in video test generator.
- Adjustment and selection of parameters with the SPI-300 programming unit, see below.
- Mains powered. Schuko type mains lead.
- 19" rack format.

Return TV Modulator

Model	MVR-600	
Reference	2562	
Selectable TV channel located between :	MHz	12 - 65
TV System		B
Audio operation mode		MONO (A2 STEREO on request)
Adjustable output level	dB μ V	89 to 104
Adjustable carrier level ratio	dB	10 to 20
Video input level	Vpp	0.7 ... 1.4
Video input impedance	Ω	75
Adjustable video modulation depth	%	80 to 90
Audio input level	Vpp	0.5 ... 2.0
Audio input impedance	Ω	> 600
Adjustable audio peak deviation	kHz	\pm 40 to \pm 50
Audio pre-emphasis	μ s	50
Applicable group retard precorrection		Yes
Weighted S/N ratio	dB	> 61
Spurious in band	dBc	< -65
Broadband noise (Δ B = 5 MHz)	dBc	< -90
Mains voltage	VAC	110 - 240 (\pm 10%)
Consumption	W	11
Video input connector		(1x) female RCA
Audio input connector		(2x) female RCA
RF output connector (TV channel)		female F
Programming interface		RS-232 - DB9
Dimensions (w x h x d)	mm	483 x 44.5 x 275

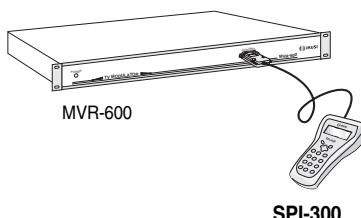

MVR-600

MVR-600 — rear panel

Programming Unit

Model	SPI-300	
Reference	4070	
<ul style="list-style-type: none"> For setting the TV channel parameters of the MVR-600 modulator : video carrier frequency, carrier level ratio, video modulation depth, audio modulation index and RF output level. Also for generating a video test signal. Cable connection to the DB-9 front panel socket. 20x4 character alphanumerical display. Numerical and function keys. Microprocessor controlled. User friendly software. No battery required. Powered through the interface lead (max consumption: 150 mA). DC jack to connect a +15 VDC voltage from an auxiliary power supply when updating the internal firmware through a PC. Dimensions: 160x75x40 mm. 		

DISTRIBUTION ELEMENTS

«DLS» — Indoor Tap-offs - 1000 MHz

- 2-, 4- and 8-way shielded directional tap-offs. Frequency range: 5-1000 MHz.
- Wall fixing, nickel-plated zinc diecast housing (2 screws attached). Grounding facilities. All ports F female connector.

► DISTRIBUTION ELEMENTS

Diverse Indoor Passive Elements with 65VAC/1A Power Passing - 2150 MHz

CE

- Directional Couplers (10 and 16 dB) — Two-way Splitter — Power Inserter
- Frequency range: 5-2150 MHz
- Power passing (65 VAC / 1A) through all ports.
- Nickle-plated zinc diecast housing. Wall-fixing (2 screws attached). All ports: F female connector. Grounding facilities.

Directional Couplers

Power pass through every port		max 65 VAC / 1A	
Hum modulation (1A)		dB	
		≤ -60	
Dimensions		mm	
		94 x 68 x 22	

IIS-100

Power Inserter

Model	IIS-100		
Reference	3377		
Insertion loss	5-862 MHz	dB	≤ 0.8
	950-1550 MHz		≤ 1.0
	1551-2150 MHz		≤ 1.3
Return loss	5-862 MHz	dB	≥ 12
	950-2150 MHz		≥ 10
Voltage/Current for insertion		max 65 VAC / 1A	
Hum modulation (1A)		dB	
		≤ -60	
Dimensions		mm	
		94 x 68 x 22	

(See ACP-425 power supply on page 118)

DISTRIBUTION ELEMENTS

Diverse Outdoor Passive Elements with 60VAC/12A Power Passing - 1000 MHz CE

TRUNK-LINE PASSIVE ELEMENTS

Three directional couplers (8, 12 and 16 dB), two splitters (2 and 3-way) and one power inserter are the trunk-line passive elements available from IKUSI for cabled distribution systems up to 1GHz. They are presented in an aluminium alloy housing with double polyurethane coating to resist corrosion and are supplied with stainless steel metallic pieces for earthing and mounting —cable, wall or pole-mounting— (angle holder Ref. 2974 required for the two last ones). A woven metallic gasket and a neoprene compression gasket provide exceptional RFI shielding (100 dB minimum) and IP67 grade weatherproofing.

The circuit board comes mounted on a faceplate but may be changed to housing to eliminate outages during diagnostics.

All ports are 5/8"-24 type. The power passing is a general feature and its high capacity is especially useful to simplify the powering and maintenance of the cable network.

Range is complemented with a 16-way splitter (page 137).

Directional Couplers — «RLDC10» Series

Diverse Outdoor Passive Elements — 1000 MHz

CE

16-WAY SPLITTER

The **GS16DGV** splitter may be used when cascading several 2- and 3-way splitters to meet the demands of dense MDU (multiple dwelling units) is needed.

It is presented in a chromate-treated zinc alloy housing to resist corrosion. Tongue and groove housing design provides exceptional RFI shielding (100 dB minimum) and an epoxy weather seal prevents water migration. Printed circuit board ensures consistent RF performance and high mechanical stability. All ports are machined "F" type.

Fitting and earthing of the housing are carried out using supplied screws.

16-way Splitter

Model	GS16DGV		
Reference	2651

► DISTRIBUTION ELEMENTS

«RMT» — Outdoor Tap-offs - 1000 MHz

CE

The IKUSI outdoor tap-off range for distribution lines in cabled systems of up to 1 GHz includes 2-, 4- and 8-way models designed to optimize signal level to the drop. They are presented in an aluminium alloy housing with double polyurethane coating to resist corrosion and provided with stainless steel metallic pieces for earthing and mounting —cable, wall or pole-mounting (angle holder Ref. 2974 required for the latter two). A woven metallic gasket and a neoprene compression gasket provide exceptional RFI shielding (100 dB minimum) and a weatherproofing IP67 grade.

The faceplate with circuit board may be taken out without removing the coaxial cables, making changes or upgrades of the system easy through single faceplate changeouts.

Line input-output ports are 5/8"-24 type and the tap ports come on neoprene sealed, nickel plated brass "F" connectors.

All units feature power passing between the two main line ports.

2-way Tap-offs — «RMT102» Series

• All the cables are manufactured using the Physical Process. Advantages: high mechanical strength, optimum electrical isolation and good stability of characteristics over time.

* Braid of the CCS-178 is highly thick (coverage factor: 60%).

** Braids of the CCS-175 and CCS-190 are highly thick (coverage factor: 70%).

*** LSOH: Low Smoke Zero Halogen. Outer sheath of the CCH-175 does not contain halogens. It is flame retardant (EN/IEC 60332-3), the density of the smoke produced when the cable is burnt is very low (EN/IEC 61034-2) and the fumes are nontoxic (IEC 60754-2).

GRT-602

19" Rack Cabinets Without Door

Model	ART-630	ART-642
Reference	3640	3641
Panel height	U	30
Outside dimensions (h x w x d)	mm	1445 x 600 x 600
Packed weight	kg	62
		82

- External structure of painted epoxy graphite grey aluminium. ABS corner pieces.
- Panel mounting members made from 2 mm thickness steel. They are fully adjustable throughout the depth of the cabinet.
- Metallic, lockable rear door.
- Ventilated top cover.
- Adjustable feet to facilitate levelling of the cabinet on a uneven surface.
- Cabinets are capable of accepting distributed loads of up to 500 kg.

Frontal Cabinet Doors

Model	PRT-030	PRT-042
Reference	3642	3643
Installing in cabinet	ART-630	ART-642
Packed weight	kg	9.5
		13

- Made from tempered, 5mm thickness, bronze-coloured security crystal. Frame of painted epoxy graphite grey aluminium.
- Doors may be hung to open from either the left or right.

19"-1U Fan Tray

Model	VRT-602
Reference	3645

- Front fixing to the cabinets. Three fans. Grilles are integrated.
- IEC mains inlet fitted in the rear (mains lead not supplied). Illuminated switch fitted in the front panel.
- Material: epoxy painted, 1 mm thickness steel. Front panel of silver anodised aluminium.
- Dimensions: 19" x 225 mm x 1U. Packed weight: 3.6 kg.

19"-1U Deflector Tray

Model	DRT-600
Reference	3805

- Deflects the upward hot air stream, so that this does not flow between the modules of the upper decks.
- Material: 1.5 mm thickness aluminium.
- Dimensions: 19" x 290 mm x 1U. Packed weight: 600 g

19"-1U Brushed Cable Entry Panel

Model	CRT-119
Reference	3644

- Provides a solution for cable access into cabinet while providing protection to the ingress of airborne dust or dirt.
- Material: epoxy painted, 1.5 mm thickness steel.
- Dimensions: 19" x 11.5 mm x 1U. Packed weight: 320 g.

Support Angles

Model	GRT-602
Reference	3646

- Provide 44.5 mm of horizontal surface along each side of the depth of the cabinet to facilitate mounting and support of heavy 19" components. Material: bi-chromated, 2 mm thickness steel.
- No screws. Anchorage to the rack is performed through flanges in the angles.
- Dimensions: 44.5 x 350 x 44.5 mm. 2 angles per box. Packed weight: 1 kg.

► USER'S EQUIPMENT

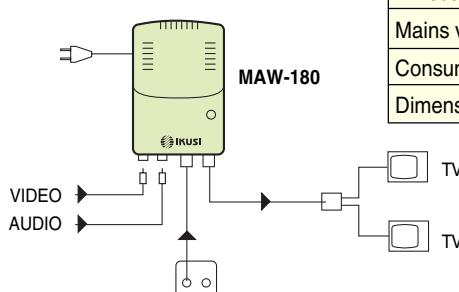

«MAW» — Home DSB TV Modulator

- Appropriate use with TV satellite receivers, VCR's and video cameras.
- Direct video/audio modulation. Multistandard. DSB response (Double Side-Band).
- Agile selection of channel. Possibility of shifting the standard video carrier frequency up to ± 2.5 MHz.
- Built-in test pattern generator.
- Two buttons and one 2-digit LED display for selection and programming of operating parameters.
- Panel potentiometers for audio modulation and RF output level settings.
- Input port for RF coupling of antenna/SMARTV signal. 75Ω load supplied to close the port when not using.
- External plastic box. Indoor mounting. Wall fixing by two screws supplied.
- Mains lead with bipolar plug. Operation shown by LED.

MAW-180

Weighted S/N ratio	dB	> 55
RF coupling loss	dB	< 1.5 (TV) „ < 2.7 (IF)
Video connector		(1x) female RCA
Audio connector		(1x) female RCA
RF output connector		(1x) female F
RF coupling connector		(1x) female F
Mains voltage	VAC	200 - 250
Consumption	W	3
Dimensions	mm	118 x 78 x 47

(RCA plugs for video and audio input connections are not supplied)

Audio/Video Interfacing Kit

Model	Ref.	Description
CVA-002	2245	<p>Includes the following accessories:</p> <ul style="list-style-type: none"> 1 plug-to-jack SCART adapter, with 3 RCA sockets (2 audio and 1 video) and 1 mini-DIN socket (S-Video). A built-in switch allows to change from input mode to output mode. 3 coaxial leads, length 1.5 m each, terminated in RCA plugs all ends.

CVA-002

► MEASURING EQUIPMENT

«DSA» — TV - SAT - CABLE - RADIO Signal Analysers

CE

DSA-500

DSA-100

Signal Analysers

DSA-500
Ref. 4815

DSA-100
Ref. 4814

The **DSA-500 & DSA-100** Signal Analysers are a new range of Digital/Analogue, Satellite & Terrestrial & Cable measurement instruments. These analysers measure actual demodulated digital parameters such as Average Digital Power, BER, SNR, MER as well as the constellation for both COFDM, DAB & QPSK carriers, and very accurate emulated BER in QAM utilizing accurate algorithms. A visual check of the digital multiplex or the Network ID can be checked on both the two instruments.

Worldwide channel plans are pre loaded on both instruments and in addition Auto Discovery of available channels quickly locates signals by transponder (for satellite) and by channel (for terrestrial) signals.

For analogue TV & FM Radio services, measurements such as signal levels, V/A ratio & CNR levels can easily be acquired at the touch of a single button.

In the **DSA-500** a second TFT high resolution screen is available to access better presentation of measured data as well as viewing actual images from the available programs in analogue as well as digital signals.

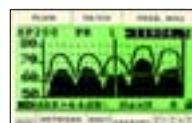

Each instrument offers two operating modes: MEAS, which provides accurate values of the parameters measured, and SPECT, which shows professional, vertical format spectrums for the frequencies and spans selected with a Max Hold function.

Both instruments are able to Data Log all results measured. All stored information can be downloaded to a PC through a USB-2 port that also provides PC control using specialized software and lifetime firmware upgrades as they come available.

Both instruments are sturdily built and come in a padded shock absorbing bag. Power is supplied through the on board long lasting Li-ion batteries or via AC mains through the AC power adapter/charger provided.

MAIN FUNCTIONS

- Measurement fields :
 - Analogue Terrestrial TV
 - DVB-T&H (COFDM)
 - FM Radio
 - Analogue Satellite TV
 - DVB-S (QPSK)
 - DVB-C (QAM) —emulation
- Spectrum analysis for TV, SAT, and FM-DAB radios
- Measurements : Level/Power, bBER, aBER, MER, SNR, CNR, EVM, Noise Margin
- 99 memory plans
- Up to 199 programs for every memory plan
- OSD graphs with stable text indications
- COFDM constellation display
- Digital signal quality analysis : Pass - Marginal - Fail
- Satellite finder automatic funcion
- Dual LNB dish alignment using the DiSEqC Switch provided
- DiSEqC motor driver
- SAT navigation by transponder number, network name & frequency
- Names of digital services, and values of audio and video PIDs
- Data Logger (measurement recording)
- LNB and mast-head preamplifier remote powering
- Buzzer varying with the quality or level of the measured parameter
- Sound of analogue television programs and FM radio
- USB interface for logged data download, channel plan upload and download, firmware updates, measurement printing through a PC
- ABS plastic casing structure
- Soft shock dampening case and strap
- Shock-, dust- and moisture-proof front panel
- Excellent view of data and graphs on the screen, in a poorly lit ambient or in direct sunlight

Additional functions in the DSA-500 model :

- Images of the TV programs (except analogue SAT and QAM cable)
- Sound of the digital television programs (except QAM cable)
- Bar Scan display of up to 100 channels on one screen
- SMATV test with Data Logger
- Impulse Response in both μ s or km for DVB-T&H echo interference analysis
- SCART A/V socket with both inputs and outputs

► MEASURING EQUIPMENT

«DSA» — TV - SAT - CABLE - RADIO Signal Analysers

(cont'd)

TECHNICAL SPECIFICATIONS

■ GENERAL

- **Input impedance:** 75Ω
- **Interchangeable & Replaceable input connector:** F - IEC - BNC
- **Power on the line protection on RF input:** up to 60 VAC
- **File Manager:** for file archive and data logger handling
- **Measurement resolution:** 0.1 dB
- **Measurement units:** dBµV - dBmV - dBm, selectable
- **RBW @ -3dB:** 100 kHz (FM); 130 kHz (TV); 4 MHz (SAT)
- **Measurement accuracy:** 1 dB typ (TV); 1.5 dB typ (SAT)
- **Measurement stability:** 0.03 dB/°C (TV); 0,1 dB/°C (SAT), between -10 and +50 °C
- **Memory plans:** 99
- **Programs:** 199 for every plan

■ TV-FM-DAB SPECTRUM ANALYSIS

- **Frequency band:** 45-870 MHz
- **Span:** 2 - 5 - 7 - 10 - 20 - 50 - 100 - 200 - 500 - VHF - UHF - FULL
- **dB/div:** 10
- **Dynamic range:** 60 dB
- **Reference level:** from 0 to 130 dBµV
- **Frequency/Level marker:** automatic position on the video carrier (analogue channels) or at the centre of the multiplex (digital channels).
- **MAX HOLD function** (peak memory): keeps the upper value obtained during a measurement course.

■ SAT SPECTRUM ANALYSIS

- **Frequency band:** 930-2250 MHz
- **Span:** 50 - 100 - 200 - 500 - FULL
- **dB/div:** 5
- **Dynamic range:** >30 dB
- **Reference level:** 0 a 130 dBµV
- **MAX HOLD function** (peak memory): keeps the upper value obtained during a measurement course.
- **SAT POINTING function:** Automatic optimum settings for dish alignment.

■ ANALOGUE TERRESTRIAL TV

- **Frequency band:** 45-870 MHz
- **Selection and memorization of:** plan No., program No., channel, DC at RF in, video carrier, audio intercarrier, TV system.
- **Frequency resolution:** 120 kHz
- **Voltage at RF IN:** Off, +5V (0.2A), +12V, +18V, +24V
- **RF level measurement dynamics:** from 5 to 123 dBµV
- **Multi-standard:** B-G-I-D-K-M-N (L opt.), PAL-SECAM-NTSC
- **V/A carrier level ratio accuracy:** 1.5 dB typ

■ FM RADIO

- **Frequency band:** 88-108 MHz
- **Selection and memorization of:** plan No., program No., channel, frequency.
- **Audio demodulation:** FM
- **Bandwidth of the demodulation filter:** 100 kHz. Sound with volume adjustable.
- **Rest of specifications:** same as ANALOGUE TERRESTRIAL TV

■ COFDM (Demodulated)

- **Frequency band:** 45-870 MHz
- **Selection and memorization of:** plan No., program No., channel, DC at RF in, channel's central frequency, carriers No., channel bandwidth.
- **Frequency resolution:** 120 kHz
- **Voltage at RF IN:** Off, +5V (0.2A), +12V, +18V, +24V
- **RF level measurement dynamics:** from 5 to 123 dBµV
- **MER measurement accuracy:** 1 dB typ (2 dB max)
- **bBER and aBER measurement:**
 - pre- : up to 2 x 10-5
 - post- : up to 2 x 10-8
- **Automatic recognition and visualization of:** Hierarchy (HP, LP), FEC (1/2, 2/3, 3/4, 5/6, 7/8), guard interval (1/4, 1/8, 1/16, 1/32) and constellation (QPSK, 16QAM, 64QAM).
- **Automatic quality analysis:** PASS-MARG-FAIL
- **Noise Margin measurement accuracy:** 1 dB
- **Spectrum inversion:** automatic

■ QAM (Emulated)

- **Frequency band:** 45-870 MHz
- **Selection and memorization of:** plan No., program No., channel, channel's central frequency, constellation, symbol rate.
- **Frequency resolution:** 120 kHz
- **RF level measurement dynamics:** from 5 to 123 dBµV
- **C/N measurement accuracy:** 1.5 dB typ (2 dB max)
- **BER evaluation:** up to 2 x 10-8
- **Automatic quality analysis:** PASS-MARG-FAIL, with exclusive algorithm "(near) nC/N" or "(far) fC/N" depending of the existence or not of adjacent channels.
- **Multiplex flatness measurement accuracy:** 1 dB typ (1.5 dB max)

■ ANALOGUE SAT TV

- **Frequency band:** 930-2250 MHz
- **Selection and memorization of:** plan No., program No., polarization, IF sub-band, DiSEqC, LNB LO frequency, transponder frequency, audio sub-carrier, video polarity, frame frequency.
- **Frequency resolution:** 4 MHz
- **Voltage at RF IN:** Off , 13V / 18V , 0 / 22 kHz
- **LNB current measurement:** 0-500 mA (only DSA-500)
- **"a.b.c.d." DiSEqC:** pre-programmed in sequence and very easy to use. Any kind of LNB (DiSEqC or not, single or dual feed) or multiswitch (4, 8, 12 or 16 inputs).
- **RF level measurement dynamics:** 30 to 123 dBµV (-79 to +14 dBm)
- **LNB LO frequency:** 0 - 20,000 MHz

■ QPSK (Demodulated)

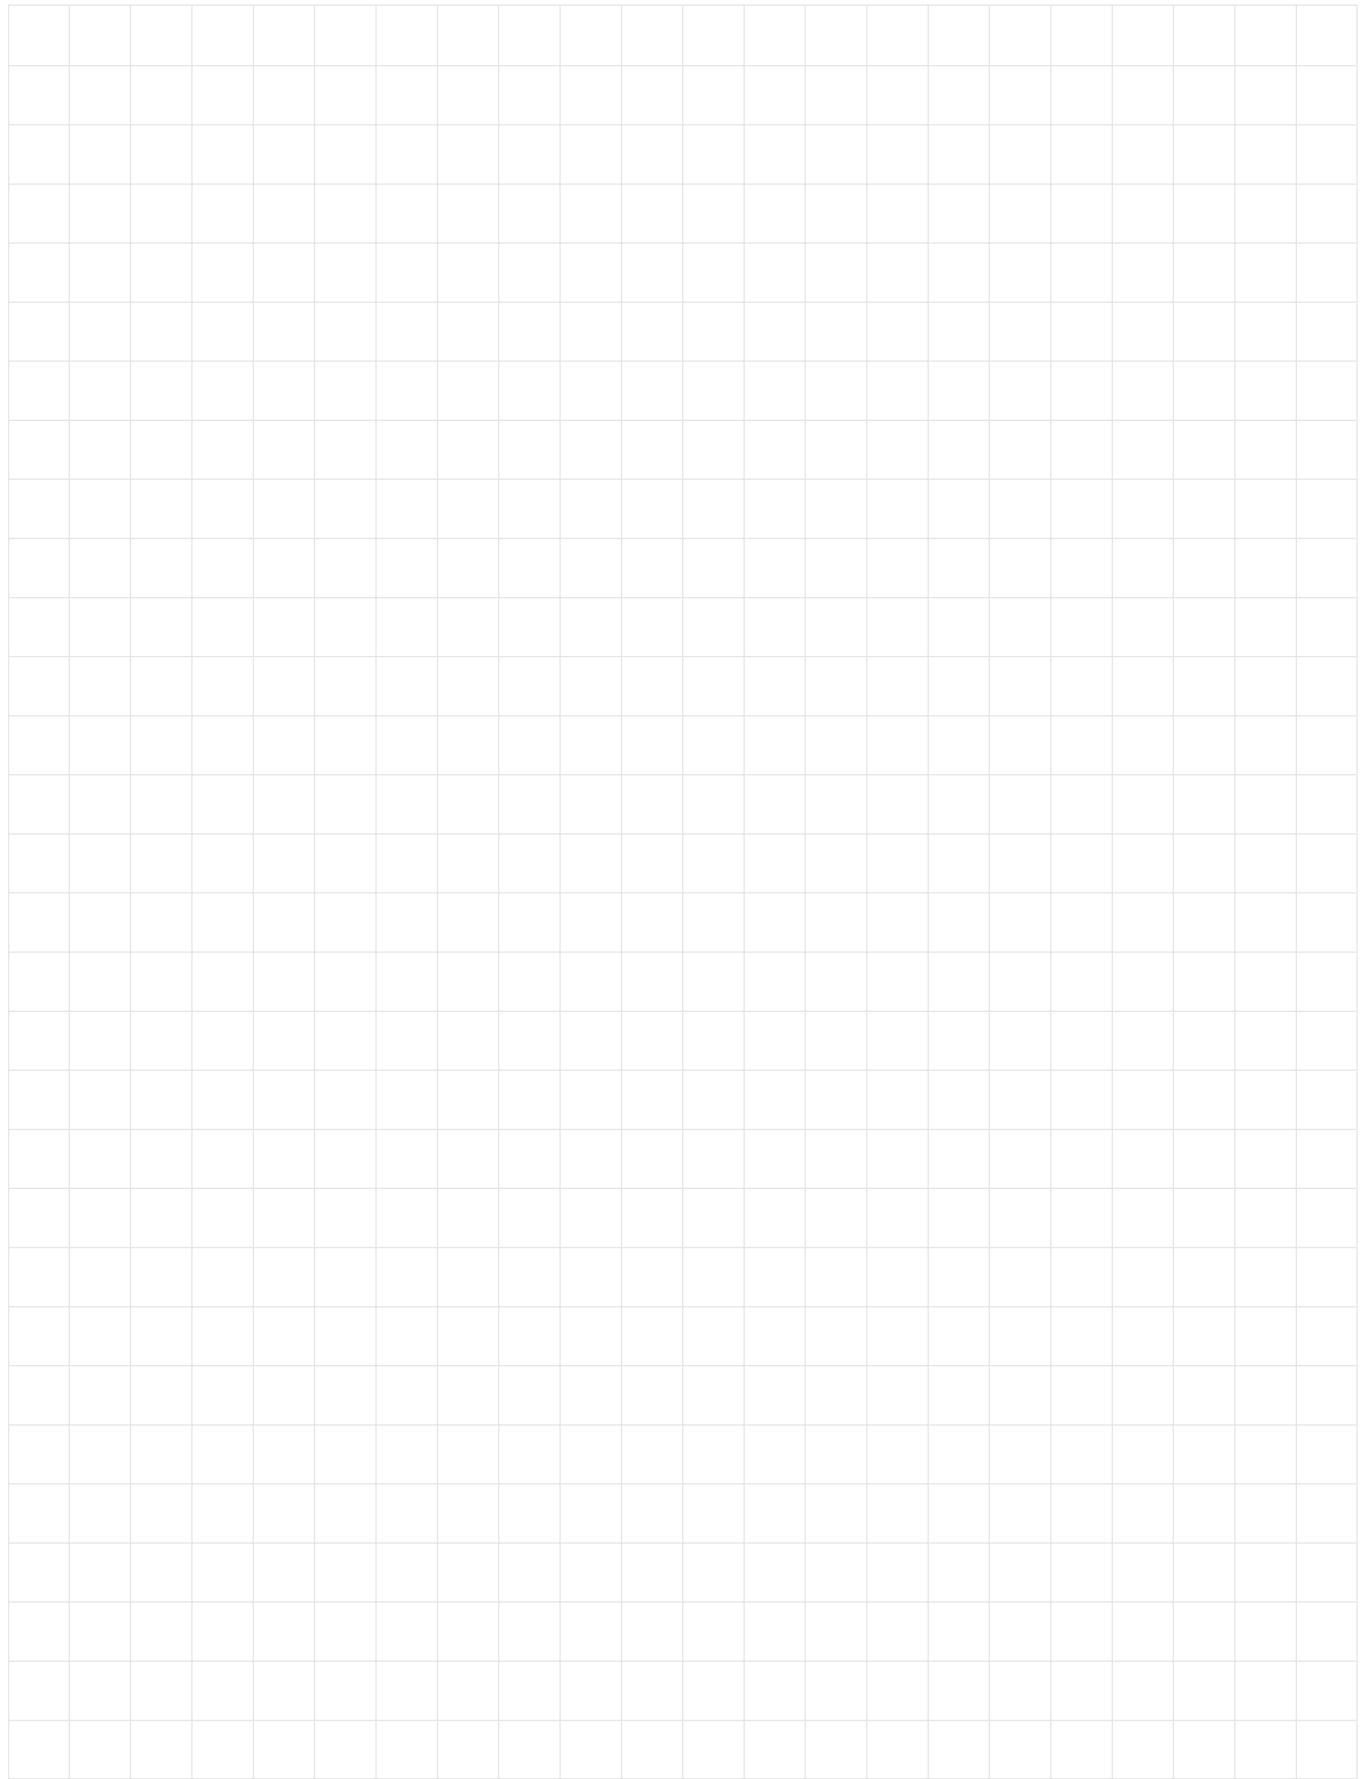

- **Frequency band:** 930-2250 MHz
- **Selection and memorization of:** plan No., program No., polarization, IF sub-band, DiSEqC, LNB LO frequency, transponder frequency, standard, symbol rate.
- **Frequency resolution:** 0.1 MHz
- **Voltage at RF IN:** Off , 13V / 18V , 0 / 22 kHz
- **LNB current measurement:** 0-500 mA (only DSA-500)
- **"a.b.c.d." DiSEqC:** pre-programmed in sequence and very easy to use. Any kind of LNB (DiSEqC or not, single or dual feed) or multiswitch (4, 8, 12 or 16 inputs).
- **RF level measurement dynamics:** 30 to 123 dBµV (-79 to +14 dBm)
- **Selection of symbol rate:** 2-45 MS/s @ 1 kS/s steps.
- **MER measurement accuracy:** 1 dB typ
- **bBER and aBER measurement:**
 - pre- : up to 2 x 10-5
 - post- : up to 2 x 10-8
- **Automatic recognition and visualization of:** FEC (1/2, 2/3, 3/4, 5/6, 7/8).
- **Automatic quality analysis:** PASS-MARG-FAIL
- **Noise Margin measurement accuracy:** 1 dB
- **LNB LO frequency:** 0 - 20,000 MHz

■ MPEG-2 DECODER (Only DSA-500)

- **NETWORK IDENTIFIER:** Names of network, transponder, bouquet and services. Conditional access system. Orbital position. Date.

■ OTHERS

- **Displays:**
 - DSA-500: 4" high resolution TFT (950 x 240 pixel) and 2.5" LCD (64 x 128 pixel)
 - DSA-100: 2.5" LCD (64 x 128 pixel)
- **Power supply:**
 - DSA-500: rechargeable batteries: 8.4V x 4.5A load voltage. 12VAC or 12-18VDC
 - DSA-100: rechargeable batteries 7.2V x 2.5A load voltage. 12VAC or 12VDC
- **Battery duration @ 25 °C:**
 - DSA-500: 4 hours (using only LCD display)
2 hours (LCD + TFT)
 - DSA-100: 2.5 hours
- **Battery charge time:** 2 hours to reach 50%, 4 hours for 80%, 12 hours for 100%
- **Battery discharge alarm:** acoustic signalling and icon on display.
- **Automatic power down timer:** 5 min.
- **PC interface:** USB
- **Video/Audio output/input** (only DSA-500): SCART.
- **Dimensions** (high x large x deep):
 - DSA-500: 110 x 280 x 160 mm
 - DSA-100: 80 x 235 x 200 mm
- **Weight (battery included):**
 - DSA-500: 2.5 kg
 - DSA-100: 1.2 kg
- **Accessories supplied:**
 - Connecting adapters: F-F, F-IEC and F-BNC
 - AC/DC charger (input 230V, output 12V)
 - USB cable
 - Car lighter adapter
 - DiSEqC switch for dual LNB dish alignment

PAY-PER-VIEW

vHOTEL System

General description

vHOTEL is a low cost, high security PPV Television System dedicated fundamentally to hotels, but also applicable to apartment complexes, hospitals and similar institutions. It may be installed into standard coaxial television distribution networks. Although the system has been especially designed to make use of Digital Terrestrial or Satellite TV channels as signal sources, others such as DVD or video camera delivered TV signals can also be applied.

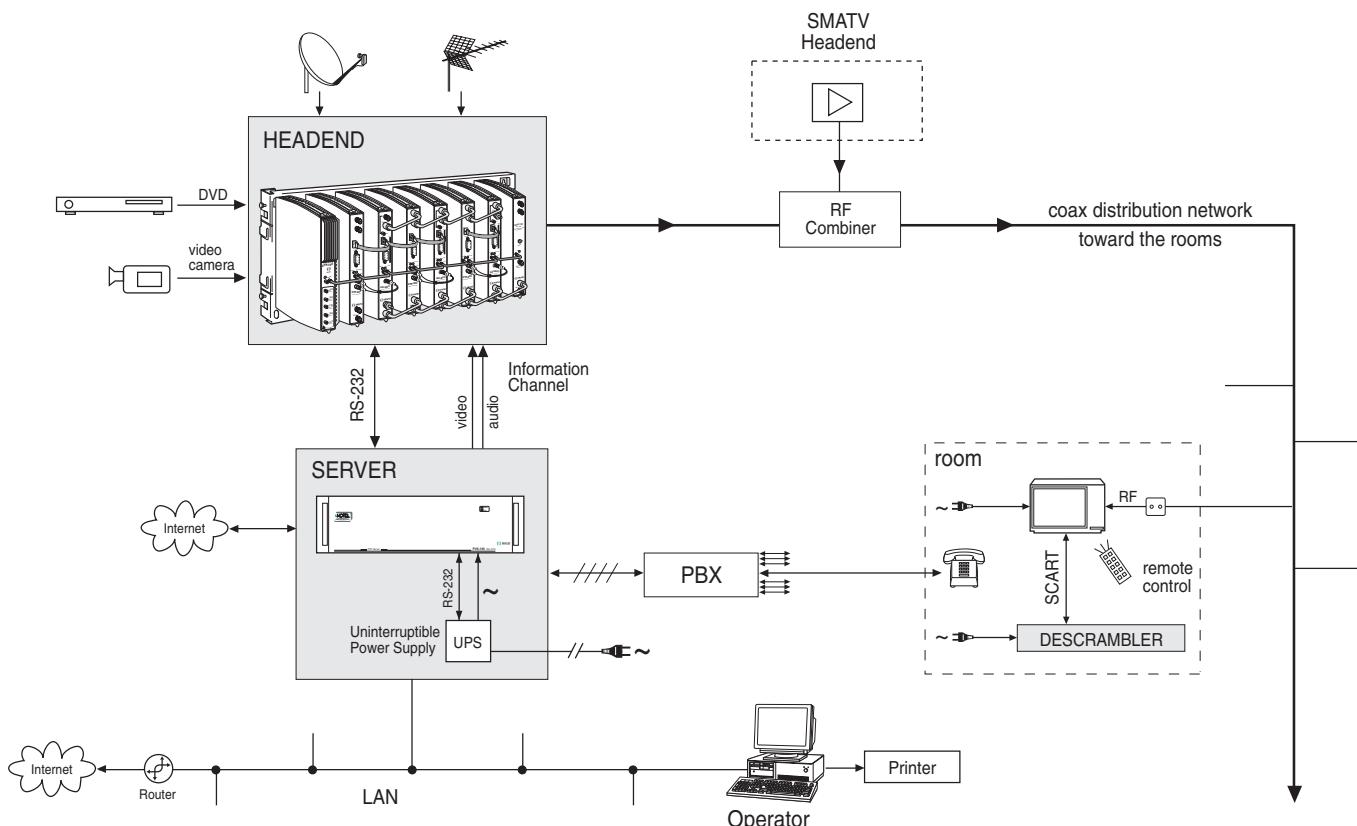

The system processes the signals of the available video sources and transmits them as vHOTEL scrambled programs on Vestigial Side Band TV channels within the 45-862 MHz band. These channels are accessible to the guest together with the clear channels of the existing SMATV installation.

vHOTEL comprises:

- a) The Headend where the scrambling modules are installed.
 - b) The Server on which the vHOTEL application runs. All data of the system are administered and maintained on this server. An UPS is supplied together.
 - c) The Room Descramblers that control the access to the pay programs. Each descrambler is configured with an address which is used by the management system.

Contact from the room to the Server is accomplished through a phone call without the need for vocal reply: guest dials the PBX's number which is shown on the screen and follows the instructions from the automatic operator. The code number of the signed up TV program and additional information (hours, cost) will have been shown on the screen when selecting it by zapping (the program may be presented cleared during a predetermined time interval). There is one unique code number for each program/room combination. Once confirmed the request, the Server sends authorization data to the headend's scrambling module that is related to the program chosen. Confidence is absolute. Processes of requesting and accessing are totally automatic; the system only requires operator's intervention for restricting access to adult programs when minors are present in the room (it is also possible to turn to the operator for a nonautomatic purchase).

vHOTEL features "Black image / No sound" scrambling. To regenerate the picture without distortion, encoded keys are transferred to the descrambler on the vertical retrace.

Shaded areas indicate the vHOTEL equipment:

- **Headend:** provides the scrambled multichannel signal. The headend contains the Scrambling Modules, one per each pay program being distributed.
 - **Server:** is the workhorse of the system. Includes an UPS (Uninterruptible Power Supply). It is connected to the headend, to the PBX and to the LAN of the hotel.
 - **Room Descrambler:** autonomous unit that requires no attention on the part of the guest. It is connected to the TV set through an SCART lead.

► PAY-PER-VIEW

«vHOTEL» — Server

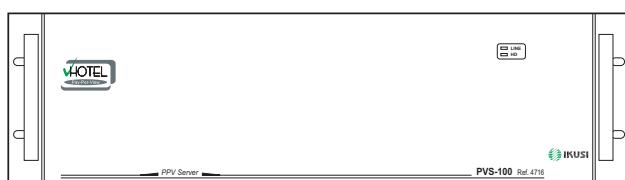

CE

Server of the vHOTEL System

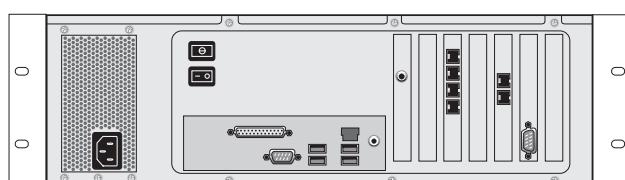

**PVS-100
Ref. 4716**

- Administration and maintenance of all data of the system, either locally or remotely via Internet.
- Internal firmware operating under Windows XP. Easy selection of particular operation parameters of the hotel. Languages: spanish, english, others in preparation.
- Connection to the headend using 2-wire shielded cable.
- Connection to the PBX through a 4-line link: up to 4 simultaneous communications. Automatic reply voice message (languages: spanish, english, french, german, others on request).
- Connection to the system operator's PC either directly or through the existing LAN .
- Internal modem to get access to the internet via PSTN. Utilizable to mail billing information to an external operating company.
- Generation of video/audio signals from image and sound files (avi, jpg, mp3, etc.) that can be combined and played with a programmable cadence. The generated V/A signal is connected to a TV modulator installed in the headend in order to create an Information Channel through which the hotel can broadcast its services as well as any type of information useful for the guest.
- Serial connection to the UPS module supplied together.
- Connection to a ticket printer either directly or through the existing LAN.
- AC input: 230 V. Runtime of the UPS: 5 minutes.
- Rack mountable. Dimensions: 19" x 520 mm x 3U
- Packed weight: 14 kg (server) + 7 kg (UPS module)

FRONT PANEL

- 1 "Power" LED.
- 1 "Activity" LED.

REAR PANEL

- 6 x RJ-11 ports. Four of them to be connected to the PBX. The other two are internal modem's.
- 2 x RS-232 serial ports to be connected to the headend and the UPS module.
- 1 x RJ-45 ethernet port to be connected to LAN or PC.
- 2 x RCA video/audio sockets to be connected to the modulator for the channel information.
- 1 x IBM compatible PC printer port.
- 4 x free USB ports.
- 1 x IEC socket for mains connection via UPS module.
- 1 x ON/OFF switch.
- 1 reset button.

PAY-PER-VIEW

«vHOTEL» — Scrambling Module

CE

- "Black image" scrambling. PAL/SECAM compatible.
- The module receives an analog video signal and returns it already scrambled and provided with the authorization information transmitted from the Server of the vHOTEL system.
- External RF through loops for noninterruption of both the antenna signal cascade and the VHF/UHF output cascade when the scrambler is paired with a ClassA receiver module (SRF-SDC-SRC-TRF-TDC-CRF-CDC-CRC types).

Scrambler

CTP-200

Model	CTP-200		
Reference	4701		
VIDEO	Input level (clear signal)	V _{pp}	1.0 ($\pm 10\%$)
	Output level (scrambled signal)	V _{pp}	equal to the level of the input signal ($\pm 5\%$)
	Impedance	Ω	75
	Luminance/Chrominance Cross Modulation	%	< 1
	Luminance/Chrominance Delay	ns	< 10
	Weighted Signal/Noise Ratio	dB	> 60
	Differential Gain	%	< 1.5
	Differential Phase	°	< 1.5
	K-Factor (2T Pulse)	%	< 2
DATA	Transmission to descrambler		on the VBI lines
	Interface of communication between modules		RS-485
	Interface of communication with the Server		RS-232
RF PATH	RF input loop-through loss (45-2150 MHz)	dB	1.0 (± 0.5)
	RF output loop-through loss (45-862 MHz)	dB	1.0 (± 0.5)
GENERAL	Supply voltage	V _{DC}	+12 (100 mA)
	Operating temperature	°C	-10 ... +55
	RF input loop connector		(2x) female F
	RF output loop connector		(2x) female F
	DC connector type		"banana" socket
	Video-loop connector type		(2x) female RCA
	Local bus connector		(2x) 4-pin socket
	Updating interface		DB-9
	Dimensions	mm	230 x 195 x 32
	Packed weight	kg	1.3

- The module is packed with:

- 2 F plug bridges, 64 mm length, for RF way-through cascades.
- 2 BUS-013 jumpers, for communication local bus cascade.
- 1 Mini-DIN to RCA jumper, for video interconnection with a ClassA receiver module.
- 1 DC plug bridge, 53 mm length, for connection of +12 VDC voltage from the CFP power supply.

Functional ClassA Modules

The **ClassA** family from IKUSI includes the following functional modules for vHOTEL headends:

- CTP-200 Video Scrambler.
- «SRF» : Receivers for Free-To-Air Digital Sat-TV.
- «SDC» : Receivers with embedded Conditional Access, for Encrypted Digital Sat-TV.
- «SRC» : Receivers with Common Interface, for Encrypted Digital Sat-TV.
- «TRF» : Receivers for Free-To-Air Digital Terrestrial-TV.
- «TDC» : Receivers with embedded Conditional Access, for Encrypted Digital Terrestrial-TV.
- «CRF» : Receivers for Free-To-Air Digital Cable-TV.
- «CDC» : Receivers with embedded Conditional Access, for Encrypted Digital Cable-TV.
- «CRC» : Receivers with Common Interface, for Encrypted Digital Cable-TV.
- «HPA-100» : RF Power Amplifiers.
- «CFP» Power Supplies.

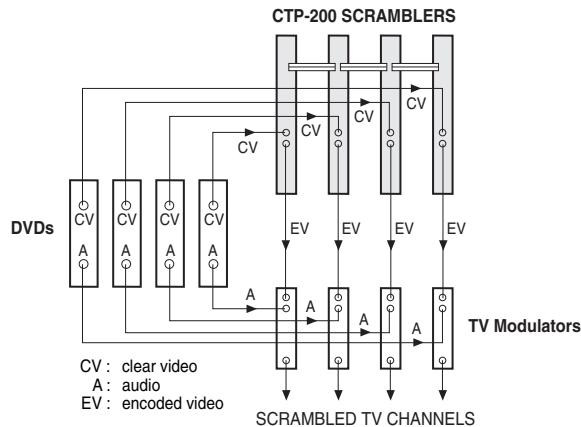

► PAY-PER-VIEW

«vHOTEL» — Headend

Headend configuration

A vHOTEL headend can be constituted by separate functional units as indicated in the illustration at right, where DVD players are being used as video sources. However, the system has been especially designed to make use of IKUSI's ClassA terrestrial and satellite receiving modules operating as "video source plus TV modulator" assemblies; one ClassA receiving module is paired with one CTP-200 scrambler to create one scrambled vHOTEL channel (see application example here below).

(ClassA receiving modules are those listed in the box at the bottom of previous page).

Application example using SDC receiving modules

SIGNAL INTERCONNECTION

Three different interconnection lines must be performed between the SDC receivers and the CTP-200 scramblers:

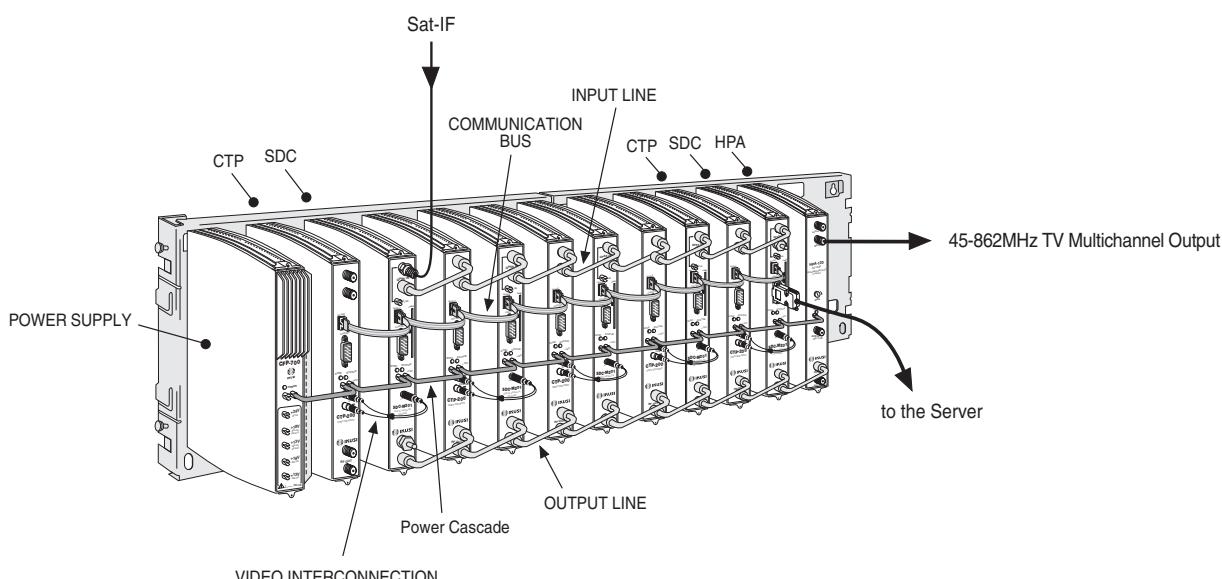

- *RF Interconnection* : Every module has two antenna loop ports and two VHF/UHF loop ports. Ones and the others are cascaded by the F plug bridges provided. The ports have a proper mission in the SDC receiving modules, while they operate as simple "RF path" in the CTP scramblers.
- *Video Interconnection* : At each SDC+CTP pair there is a SDC→CTP clear video transmission and a reverse CTP→SDC scrambled video transmission. These transmissions are assured by the video jumpers provided.
- *Data Interconnection* : Each one of the SDC and CTP modules has 2 small 4-pin sockets which are used to install a property communication bus through the jumpers provided.

POWER CONNECTION

All modules SDC and CTP are +12 VDC powered by the CFP-700 Power Supply. Each module has two DC banana sockets that allow to build a power cascade through the DC plug bridges provided.

CONNECTION TO THE CENTRAL CONTROLLER

The headend uses an RS-232 interface to communicate with the Server. Connection is made on the last scrambler module at the right end of assembly.

- Example of «vHOTEL» headend for 5 scrambled TV stations. Contains 5 Receiver+Scrambler pairs (SDC+CTP), 1 HPA-120 Amplifier and 2 CFP-700 Power Supply Modules, all fixed on 2 horizontally joined BAS-700 Base-Plates.

► PAY-PER-VIEW

«vHOTEL» — Room Descrambler

CE

- Addressing by internal DIP-switch. Up to 2048 rooms.
- PAL/SECAM baseband input/output.
- Wall-fixing. Inviolable closing.

Room Descrambler

DTP-200

Model		DTP-200	
Reference		4700	
VIDEO	Input/output level		According to EN 50049-1
	Luminance/Chrominance Cross Modulation		% < 3
	Luminance/Chrominance Delay		ns < 10
	Weighted Signal/Noise Ratio		dB > 48
	Differential Gain		% < 1.5
	Differential Phase		° < 1.5

(1) Sound carrier is different :

Systems K, L :
Sound carrier = Picture carrier + 6.5 MHz

System I :
Sound carrier = Picture carrier + 6 MHz

Output level reduction in broadband amplifiers

BROADBAND TERRESTRIAL TV AMPLIFIERS : The RF output levels specified in this catalogue for IMD3=-60 dB (DIN 45004 B) are applicable when 2 analog TV channels are amplified. If, as is usual, more than 2 TV channels are amplified, such levels have to be reduced according to the following table:

Number of channels (n)	2	3	4	5	6	7	8	9	10	15	20	
Output level reduction = $7.5 \cdot \log(n-1)$	dB	0	2	3.5	4.5	5	5.5	6	6.5	7	8.5	9.5

FM, DAB AND COFDM SIGNALS : If output levels of the FM, DAB and Digital TV (COFDM) signals are adjusted 10 dB or more below the levels of the analog TV channels, those signals can be ignored when calculating the output reduction level. If referred levels are not reduced as indicated, those signals must be counted as normal channels and the output level de-rated accordingly.

BROADBAND SATELLITE TV OR DIGITAL TERRESTRIAL TV AMPLIFIERS : The RF output levels specified in this catalogue for IMD3=-35 dB (EN 50083-3) are applicable when 1 FM-, QPSK- or COFDM-modulated TV channel is amplified. For a bigger number of channels, such levels have to be reduced according to the following table:

Number of channels (n)	2	3	4	5	6	7	8	9	10	15	20	
Output level reduction = $10 \cdot \log n$	dB	3	4.5	6	7	8	8.5	9	9.5	10	11.5	13

CASCADE REDUCTION : When m same-type broadband amplifiers are laid out in cascade, an additional reduction of the output level equals $10 \cdot \log m$ must be taken into account for every amplifier.

20	10.0 μ V	11.2 μ V	12.6 μ V	14.1 μ V	15.8 μ V	17.8 μ V	20.0 μ V	22.4 μ V	25.1 μ V	28.2 μ V
30	31.6 μ V	35.5 μ V	39.8 μ V	44.7 μ V	50.1 μ V	56.2 μ V	63.1 μ V	70.8 μ V	79.4 μ V	89.1 μ V
40	100 μ V	112 μ V	126 μ V	141 μ V	158 μ V	178 μ V	200 μ V	224 μ V	251 μ V	282 μ V
50	316 μ V	355 μ V	398 μ V	447 μ V	501 μ V	562 μ V	631 μ V	708 μ V	794 μ V	891 μ V
60	1.0 mV	1.1 mV	1.3 mV	1.4 mV	1.6 mV	1.8 mV	2.0 mV	2.2 mV	2.5 mV	2.8 mV
70	3.2 mV	3.5 mV	4.0 mV	4.5 mV	5.0 mV	5.6 mV	6.3 mV	7.1 mV	7.9 mV	8.9 mV
80	10.0 mV	11.2 mV	12.6 mV	14.1 mV	15.8 mV	17.8 mV	20.0 mV	22.4 mV	25.1 mV	28.2 mV
90	31.6 mV	35.5 mV	39.8 mV	44.7 mV	50.1 mV	56.2 mV	63.1 mV	70.8 mV	79.4 mV	89.1 mV
100	100 mV	112 mV	126 mV	141 mV	158 mV	178 mV	200 mV	224 mV	251 mV	282 mV
110	316 mV	355 mV	398 mV	447 mV	501 mV	562 mV	631 mV	708 mV	794 mV	891 mV
120	1.0 V	1.1 V	1.3 V	1.4 V	1.6 V	1.8 V	2.0 V	2.2 V	2.5 V	2.8 V

Ex.: 66 dB μ V = 2.0 mV

125 dB μ V = 1.8 V

«dB μ V / dBm» conversion on 75Ω

Convert dB μ V to dBm → Subtract 108.7 from the figure in dB μ V :

$$(N) \text{ dB}\mu\text{V} = (N - 108.7) \text{ dBm}$$

Ex.: 110 dB μ V = 1.3 dBm

Convert dBm to dB μ V → Add 108.7 to the figure in dBm :

$$(M) \text{ dBm} = (M + 108.7) \text{ dB}\mu\text{V}$$

Ex.: -50 dBm = 58.7 dB μ V

«dB μ V / dBmV» conversion

Convert dB μ V to dBmV → Subtract 60 from the figure in dB μ V :

$$(N) \text{ dB}\mu\text{V} = (N - 60) \text{ dBmV}$$

Ex.: 100 dB μ V = 40 dBmV

Convert dBmV to dB μ V → Add 60 to the figure in dBmV :

$$(M) \text{ dBmV} = (M + 60) \text{ dB}\mu\text{V}$$

Ex.: 22 dBmV = 82 dB μ V

Earthing and equipotencial bonding cables

The EN 50083-1 standard specifies the following earthing and equipotential bonding cables for antenna systems:

Earthing cables:

Material	Cross-section	Ø	Condition
Copper	$\geq 16 \text{ mm}^2$	$\geq 4.6 \text{ mm}$	bare or insulated
Aluminium	$\geq 25 \text{ mm}^2$	$\geq 5.7 \text{ mm}$	bare (indoors only) or insulated
Aluminium	$\geq 50 \text{ mm}^2$	$\geq 8.0 \text{ mm}$	(wrought) alloy
Steel wire	-	8.0 mm	galvanized
Steel strip	2.5 x 20 mm	-	galvanized

Cable type: single conductor or multi-conductor, but no fine wires

Equipotential bonding cables:

Material	Cross-section	Ø	Condition
Copper	4 mm ²	2.3 mm	bare or insulated
